Chemical symbol, S; atomic weight, 32.06. An elementary substance which occurs in nature as a brittle crystalline solid, with resinous luster, almost tasteless, and emitting when rubbed or warmed a peculiar characteristic odor. It is a non-conductor of electricity. Its specific gravity is 2.05. It is insoluble in water, nearly so in alcohol and in ether, but quite soluble in carbon disulphid, petroleum, benzine, etc. It burns in the air with a blue flame, and is oxidized to sulphur dioxide or sulphurous acid. It melts at 238° F., and boils at 824° F., giving off a dense red vapor. Sulphur exists in two distinct crystalline forms, and also as an amorphous variety; these modifications are characterized by differences in specific gravity, in solubility in various liquids, and in many other respects. Between its melting-point and 280° F. it is most fluid, and when cast in wooden molds it forms the stick-sulphur or brimstone of commerce. Between 430° and 480° it becomes much less liquid, and can with difficulty be poured. If poured into water, it forms a ductile mass called *plastic sulphur*, which may be used for taking impressions of coins, etc. On standing it becomes hard and brittle. From 480° to its boiling-point it is liquid again. Sulphur occurs in great abundance and purity in the neighborhood of active and extinct volcanoes. As an article of commerce, most of it is brought from Sicily. It is also widely distributed in combination with other elements, chiefly in the form of sulphates and sulphids, and it is now extensively obtained from the native sulphids of iron and copper for use in the manufacture of sulphuric acid. It also occurs sparingly in animal and vegetable tissues. Sulphur combines with oxygen, hydrogen, chlorine, etc., to form important compounds, of great use in the arts. It is used in the pure state extensively in the manufacture of gunpowder and matches, and for vulcanizing rubber. Refined sulphur, prepared by sublimation from the crude substance, is used in medicine as a laxative, diaphoretic, and resolvent; it is also largely employed in skin-diseases, both internally and externally. From the sixteenth to the eighteenth century casts or copies of antique gems were frequently made by pouring into a mold melted sulphur colored with metallic oxides.

**Sulphuric acid**,  $H_2SO_4$ , oil of vitriol, a dense oily colorless fluid, having, when strongly concentrated, a specific gravity of about 1.8. It is exceedingly acid and corrosive, decomposing all animal and vegetable substances by the aid of heat. It has a very great affinity for water, and unites with it in every proportion, evolving at the same time great heat; it attracts moisture strongly from the atmosphere, becoming rapidly weaker if exposed. When the concentrated acid is heated, sulphur trioxid is given off, and at about  $640^\circ F.$  it boils and distills unchanged. The sulphuric acid of commerce is never pure, but may contain lead sulphate dissolved from the lead chambers during the process of manufacture, arsenic, and other impurities. It was formerly procured by the distillation of dried iron sulphate, called *green vitriol*, whence the corrosive liquid which came over in the distillation, having an oily consistence, was called *oil of vitriol*. It is now prepared in the United States and most other countries by burning sulphur, or frequently iron pyrites, in closed furnaces, and leading the fumes, mixed with oxides of nitrogen, into large leaden chambers, into which jets of steam are continuously sent. The oxides of nitrogen are produced by the action of sulphuric acid upon niter contained in pots, which are placed between the sulphur-ovens and the chambers. The sulphur dioxide takes away part of the oxygen from the oxides of nitrogen, which are again oxidized by the air in the chambers. The sulphur trioxid produced unites with the steam to form sulphuric acid. The acid produced in the chamber, called *chamber acid*, which has a specific gravity of about 1.5 and contains 64 per cent. of  $H_2SO_4$ , is concentrated in leaden vessels until it reaches a specific gravity of 1.71 and contains 78 per cent. of  $H_2SO_4$ , when it is run into glass or sometimes into platinum vessels, where the concentration is continued. By concentrating sulphuric acid as far as possible and then cooling sufficiently, crystals of the true acid  $H_2SO_4$  are obtained. The ordinary acid is a hydrate containing varying amounts of water. A form of sulphuric acid known as *Nordhausen acid*, or *fuming sulphuric acid*, is prepared by heating iron protosulphate or green vitriol in closed vessels; it is a solution of variable quantities of sulphur trioxid in sulphuric acid, or it may be regarded as pyrosulphuric acid,  $H_2S_2O_7$ . It is largely used in the manufacture of artificial alizarin.

Sulphuric acid is a strong dibasic acid, and forms both acid and neutral salts. It is found uncombined in natural waters of certain volcanic districts. Its salts are universally distributed in nature, and are most extensively used in the arts. The free acid is more widely used than any other, and is the agent for releasing other acids from their salts and preparing them in a pure state. See *sulphate*.—**Sulphuric caustic**, strong sulphuric acid made into a paste with plaster of Paris, saffron, or lint.—**Sulphuric ether**,  $(C_2H_5)_2SO$ , ethyllic, vinic, or ordinary ether, a colorless mobile liquid, of a pleasant smell and pungent taste; specific gravity, 0.720. It is extremely volatile and highly inflammable; and its vapor, mixed with oxygen or atmospheric air, forms a very dangerous explosive mixture. It dissolves in ten parts of water, and is miscible with alcohol and the fatty and volatile oils in all proportions. It is employed in medicine as a stimulant and antispasmodic. The vapor of the ether when inhaled has at first an exhilarating intoxicating effect, which is soon followed by partial or complete insensibility. It is largely used as an anesthetic in surgical operations, either alone or mixed with chloroform. It is prepared by distilling a mixture of alcohol and sulphuric acid; hence the name *sulphuric ether*, although sulphuric acid does not enter into its composition. True sulphuric ether, also known as *ethyl sulphate*,  $(C_2H_5)_2SO_4$ , is an oily liquid, of burning taste and ethereal odor, resembling that of peppermint, of specific gravity 1.120, and may be distilled without decomposition under diminished pressure at a temperature of about  $400^\circ F.$ —**Sulphuric oxid**, or *sulphur trioxid*,  $SO_3$ , a white crystalline body produced by the oxidation of sulphurous oxid (which see, under *sulphurous*). When this oxid is thrown into water, it combines rapidly with it to form sulphuric acid.

**Sulphurous oxid**,  $SO_2$ , a gas formed by the combustion of sulphur in air or dry oxygen. It is transparent and colorless, of a disagreeable taste, a pungent and suffocating odor, is fatal to life, and very injurious to vegetation. By the aid of pressure and cold it may be reduced to the liquid state. It extinguishes flame, and is not itself inflammable. It has bleaching properties, so that the fumes of burning sulphur are often used to whiten straw, and silk and cotton goods. It is also used as an antiseptic. This gas is also called *sulphur dioxide*; when led into water it forms *sulphurous acid*,  $H_2SO_3$ . This acid readily takes up oxygen, passing into sulphuric acid; it is dibasic, forming salts called *sulphites*. Sulphurous acid gas is called in the trade vapor of burning brimstone.

A product of the dried and ground leaves of certain shrubs or trees of the genus *Rhus* or of other genera, much used for tanning light-colored leathers and to some extent for dyeing. The leading source of this product is the tanners' or Sicilian sumac, *Rhus Coriaria*, of southern Europe, cultivated in Sicily and also in Tuscany. The Venetian sumac, smoke-tree, or wig-tree, *R. Cotinus*, is grown in Tyrol for the same purpose. (See *smoke-tree* and *scotino*.) In France a tree of another genus, *Coriaria myrtifolia*, myrtle-leaved sumac, furnishes a similar product. (See *Coriaria*.) In the United States, particularly in Virginia, the leaves of several wild sumacs are now gathered as tan-stock—namely, of the dwarf, the smooth, the stag-horn, and perhaps the Canadian sumac. These contain more tannin than the European, but, at least with careless gathering, they make an inferior leather.—**Canadian sumac**, a low straggling bush, *Rhus Canadensis* (*R. aromatica*), found from Canada southward. Also black or mountain sumac.—**Jamaica sumac.** Same as *coral-sumac*.—**Laurel sumac**, the Californian *Rhus laurina*, a large evergreen much-branched and very leafy shrub, exhaling an aromatic odor. The leaves are smooth, somewhat glaucous, whitened beneath. It bears a large panicle of small crimson drupes, which are pleasantly acid, and officially recognized as astringent and refrigerant. A strong decoction or diluted fluid extract forms an effective gargle. Also *Pennsylvania, upland, or white sumac*.—**Stag-horn or stag's-horn sumac**, a shrub or small tree, *Rhus typhina*, of eastern North America. It is a picturesque species with irregular branches (suggesting the name), abundant long pinnate leaves, and in autumn pyramidal panicles of velvety crimson drupes. Its branchlets and leafstalks are densely velvety-hairy. Its wood is satiny, yellow streaked with green, occasionally used for inlaying. Its fruit is of a similar quality with that of *R. glabra*, both sometimes called *vinegar-tree*. Its bark and foliage are sometimes used for tanning and dyeing.—**Swamp sumac.** Same as *poison-sumac*.—**Tanners' or tanning sumac**, specifically, *Rhus Coriaria*, a tree resembling the stag-horn sumac. The central body of the solar system, around which the earth and other planets revolve, retained in their orbits by its attraction, and supplied with energy by its radiance. Its mean distance from the earth is a little less than 93 millions of miles, its horizontal parallax being 8".59 ± 0".02. Its mean apparent diameter is 32' 04"; its real diameter 864,500 miles, 1094 times that of the earth. Its volume, or bulk, is therefore a little more than 1,300,000 times that of the earth. Its mass—that is, the quantity of matter in it—is 330,000 times as great as that of the earth, and is about 900 times as great as the united masses of all the planets. The force of gravity at the sun's surface is nearly 28 times as great as at the earth's surface. The sun's mean density (mass ÷ volume) is only one fourth that of the earth, or less than one and a half times that of water. By means of the spots its rotation can be determined. It is found that the sun's equator is inclined 74° to the plane of the ecliptic, with its ascending node in (celestial) longitude 73° 40'. The period of rotation appears to vary systematically in different latitudes, being about 25 days at the equator, while in solar latitude 40° it is fully 27. Beyond 45° there are no spots by which the rate of rotation can be determined. The cause of this peculiar variation in the rate of the sun's surface motion is still unex-

plained, and presents one of the most important problems of solar research. The sun's visible surface is called the *photosphere*, and is made up of minute irregularly

The Sun (after Winlock).

rounded "granules," intensely brilliant, and apparently floating in a darker medium. These are usually 400 or 500 miles in diameter, and so distributed in streaks and groups as to make the surface, seen with a low-power telescope, look much like rough drawing-paper. Near sun-spots, and sometimes elsewhere, the granules are often drawn out into long filaments. (See *sun-spot*.) In the neighborhood of the sun-spots, and to some extent upon all parts of the sun, faculae (bright streaks which are due to an unusual crowding together and upheaval of the granules of the photosphere) are found. They are especially conspicuous near the edge of the disk. At the time of a total eclipse certain scarlet cloud-like objects are usually observed projecting beyond the edge of the moon. These are the prominences or protuberances, which in 1868 were proved by

An Eruptive Prominence.

the spectroscopic to consist mainly of hydrogen, always, however, mixed with at least one other unidentified gaseous element (provisionally named *helium*), and often interpenetrated with the vapors of magnesium, iron, and other metals. It was also immediately discovered by Janssen and Lockyer that these beautiful and vivacious objects can be observed at any time with the spectroscopic, and that they are only extensions from an envelop of incandescent gases which overlies the photosphere like a sheet of scarlet flame, and is known as the *chromosphere*. Its thickness is very irregular, but averages about 5,000 miles. The prominences are often from 50,000 to 100,000 miles in height, and occasionally exceed 200,000; they are less permanent than the spots, and their changes and motions are correspondingly swift. They are not confined to limited zones of the sun's surface; those of the greatest brilliancy and activity are, however, usually connected with spots, or with the faculae which attend the spots. The corona—the most impressive feature of a total eclipse—is a great "glory" of irregular outline surrounding the sun, and composed of nebulous rays and streams which protrude from the solar surface, and extend sometimes to a distance of several millions of miles, especially in the plane of the sun's equator. The lower parts are intensely bright, but the other parts are faint and indefinite. Its real nature, as a true solar appendage and no mere optical or atmospheric phenomenon, has been abundantly demonstrated by both the spectroscopic and the camera. Its visual spectrum is characterized by a vivid bright line in the green (the so-called 1474 line, first observed in 1860) and by the faintly visible lines of hydrogen. Since then many other lines have been brought out by photography in the violet and ultra-violet parts of the spectrum. This proves that the corona consists largely of some unidentified gaseous element (provisionally known as *coronium*), mingled to some extent with hydrogen, and metallic vapors, and probably impregnated with meteoric dust. The fact that the corona is observable only during the few moments of a total solar eclipse makes its study slow and difficult. Huggins has attempted to overcome the difficulty by means of photography, and, though without an absolute success so far, the results are not wholly discouraging. The spectroscopic enables us to determine the presence in the sun of certain well-known terrestrial elements in the state of vapor. The solar spectrum is marked by numerous dark lines (known as *Fraunhofer's lines*), and between 1850 and 1860 their explanation was worked out as depending upon the selective absorption due to the transmission of the light from the photosphere through the overlying atmosphere of cooler gases and vapors. Kirchhoff was the first (in 1859) to identify many of the

familiar elements whose vapors thus impress their signature upon the sunlight. According to the recent investigations of Rowland (not yet entirely completed), thirty-six of the chemical elements are already identified in the solar atmosphere, all of them metals, hydrogen excepted. Among them barium, calcium, carbon, chromium, cobalt, hydrogen, iron, magnesium, manganese, nickel, silicon, sodium, titanium, and vanadium are either specially conspicuous or theoretically important. The fact that some of the most abundant and important of the terrestrial elements fail to show themselves is, of course, striking, and probably significant. Chlorine, oxygen (probably), nitrogen, phosphorus, and sulphur are none of them apparent; it would, however, be illogical and unsafe to infer from their failure to manifest themselves that they are necessarily absent. A difference of opinion prevails as to the precise region of the solar atmosphere in which Fraunhofer's lines originate. Some hold that the absorption which produces them takes place almost entirely in a comparatively thin stratum known as the *reversing-layer*, just above the surface of the photosphere. Lockyer holds, on the other hand, that many of them originate at a high elevation, and even above the chromosphere. Photometric observations show that the brilliance of the solar surface far exceeds that of any artificial light; it is about 150 times as great as that of the lime-cylinder of the calcium-light, and from two to four times as great as that of the "crater" of the electric arc. It is to be noted that the brightness of the sun's disk falls off greatly near the edge, owing to the general absorption by the solar atmosphere. The solar constant is defined as the quantity of heat (in calories) received in a unit of time by an area of a square meter perpendicularly exposed to the sun's rays at the upper surface of the earth's atmosphere, when the earth is at its mean distance from the sun. This quantity can be determined, with some approach to accuracy (say within 10 or 15 per cent.), by observations with pyrheliometers and actinometers. The earliest determinations (by J. Herschel and Pouillet, in 1838) gave about 19 calories a minute; later and more elaborate observations give larger results. Langley's observations make it very probable that its value is not under 30. Assuming it, however, as 25, it appears that the amount of energy incident upon the earth's atmosphere in the sun's rays is nearly 24 continuous horse-power per square meter when the sun is vertical; at the sea-level this is reduced about one third by the atmospheric absorption. The total amount of energy radiated by the sun's surface defies conception; it is fully 100,000 continuous horse-power or more than 1,100,000 calories a minute for every square meter, and according to Eriesson more than 400 times as great as that radiated by a surface of molten iron. It would melt in one minute a shell of ice 50 feet thick incasing the photosphere; to supply an equal amount by combustion would require the hourly burning of a layer of the best anthracite more than 20 feet thick—more than a ton for every square foot of surface. As to the temperature of the sun, our knowledge is comparatively vague. We have no means of determining with accuracy from our present laboratory data the temperature the photosphere must have in order to enable it to emit heat at the known rate. Various (and high) authorities set it all the way from about 2,500° C. to several millions of degrees. Experiments with burning-glasses, however, and observations upon the penetrating power of the solar rays, demonstrate that the temperature of the photosphere is certainly higher than that of any known terrestrial source, even the electric arc itself. The only theory yet proposed concerning the maintenance of the sun's heat which meets the case at all is that of Helmholtz, who finds the explanation in a slow contraction of the solar globe. A yearly shrinkage of about 250 feet (or 300 feet, if we accept Langley's value of the solar constant) in the sun's diameter would make good the whole annual expenditure of radiant energy, and maintain the temperature unchanged. If this is the true explanation, it follows, of course, that in time—probably in about eight or ten millions of years—the solar heat will begin to wane, and will at last be exhausted. It should be noted also that certain other causes—such, for instance, as the fall of meteors on the sun—contribute something to its heat-supply; but all of them combined will account for not more than a small percentage of the whole. The view now generally accepted of the constitution of the sun accords with this theory of the solar heat. The sun is believed to be, in the main, a mass of intensely heated gas and vapor, powerfully compressed by its own gravity. The central part is entirely gaseous, because its temperature, being from physical necessity higher than that of the inclosing photosphere, is far above the so-called "critical point" for every known element; no solidification, no liquefaction even, can therefore occur in the solar depths. But near the outer surface radiation to space is nearly free, the temperature is lowered to a point below the "critical point" of certain substances, and under the powerful pressure due to solar gravity condensation of the vapors begins, and thus a sheet of incandescent cloud is formed, which constitutes the photosphere. The chromosphere consists of the permanent gases and uncondensed vapors which overlie the cloud-sheet, while the corona still remains in great degree a mystery, as regards both the substances which compose it and the forces which produce and arrange its streamers. L. *dies solis*): *AS. sunnan*, gen. of *sunne*, sun; *dæg*, day: see *sun<sup>1</sup>* and *day<sup>1</sup>*.] *I. n.* The first day of the week; the Christian Sabbath; the Lord's Day. See *Sabbath*.

The name *Sunday*, or 'day of the Sun,' belongs to the first day of the week on astrological grounds, and has long been so used, from far beyond the Christian era, and far outside of Christian countries. (See *week*.) The ordinary name of the day in Christian Greek and Latin and in the Romanic languages is the *Lord's Day* (Greek *κυριακή*, Latin *dominica*, French *dimanche*, etc.), while the Germanic languages, including English, call it *Sunday*. In the calendar of the Roman Catholic and Anglican churches the Sundays of the year form two series—one reckoned from Christmas, and one from Easter. The first series consists of four Sundays in Advent, one or two Sundays after Christmas, and the Sundays after Epiphany, from one to six in number, according to the date of Septuagesima. The second series consists of the remaining Sundays of the year—namely, Septuagesima, Sexagesima, Quinquagesima, six Sundays in Lent, Easter Sunday, five Sundays after Easter, Sunday after Ascension, Pentecost or Whitsunday, and the Sundays after Pentecost (the first of which is Trinity Sunday), from twenty-three to twenty-eight in number, or the Sundays after Trinity (according to the usage of the Anglican Church), from twenty-two to twenty-seven in number, the last of these being always the Sunday next before Advent. On the Sundays after Pentecost or Trinity not provided with offices of their own are used the offices of the Sundays omitted after Epiphany. In the Greek Church the first Sunday of the ecclesiastical year is the Sunday of the Publican and Pharisee, which is that next before Septuagesima. Then follow the Sundays of the Prodigal Son, of Apoceros, of Tyrophagus, the six Sundays of Lent, Easter, (called *Pascha* or *Bright Sunday*), the five Sundays after Easter (called of *St. Thomas*, of *Antipascha*, of the *Giftment-bearers*, of the *Paralytic*, of the *Samaritan Woman* or *Mid-Pentecost*, of the *Blind Man*), the Sunday after Ascension (called of the *Three Hundred and Eighteen Fathers of Nicaea*), Pentecost, and All Saints' Sunday, answering to Trinity Sunday. The Sundays after Pentecost are numbered continuously till the Sunday of the Publican and Pharisee is again reached. They are mostly named after the evangelist from whom the gospel for the day is taken. They are called *Sundays of St. Matthew* from Pentecost till the Exaltation of the Cross (September 14th), when two Sundays are called *Sunday before* and *after the Exaltation* respectively. After this follow the *Sundays of St. Luke*. The Sundays corresponding to the third and fourth in Advent are the Sunday of the Holy Forefathers and the Sunday before Christmas, and the Sundays next preceding and succeeding the Epiphany are called *Sunday before* and *after the Lights*. Some Sundays of St. Matthew, if omitted before the Exaltation, are transferred to the time after the Epiphany. The seventeenth or last Sunday of St. Matthew is called the *Sunday of the Canaanitish Woman*.

The best-known of these is *D. rotundifolia*, the round-leaved sundew of both continents, having small white flowers. **sun-dial** (sun'di'ál), *n.* [Early mod. E. also *sunne-diall*; *< sun*<sup>1</sup> + *dial*.] An instrument for indicating the time of day by means of the position of a shadow on a dial or diagram. The shadow used is generally the edge of a gnomon, which edge must be parallel to the earth's axis, about which the sun revolves uniformly in consequence of the earth's diurnal rotation. If a series of imaginary planes through the edge (one in the meridian and the others inclined to one another by successive multiples of 15°) be cut by the plane of the dial, the intersecting lines will be in the positions of the hour-lines of the dial. The shadow of any given point upon the gnomon-edge will fall at different positions on the hour-line according to the declination of the sun, and this circumstance may be used to make the dial show mean instead of apparent time. But this is inconvenient, and seldom used. Portable sun-dials used often to be made so that their indications depended exclusively on the altitude of the sun; such dials require adjustment for the time of the year. See *dial*. — To rectify a sun-dial. See *rectify*.

**sunshine-recorder** (sun'shīn-rē-kōr'dēr), *n.* An instrument for registering the duration of sunshine. Two principal forms have come into use, one utilizing the heating effect, the other the actinic effect, of the sun's rays. The Campbell sunshine-recorder consists of a glass sphere which acts as a lens, with its focus on a curved strip of millboard. The sun's rays, focused by the sphere, burn a path on the millboard as the sun moves through the heavens. The length of the burnt line indicates the duration of sunshine, or, more strictly, the length of time that the sun shines with sufficient intensity to burn the millboard. The photographic sunshine-recorder consists of a dark chamber into which a ray of light is admitted through a pinhole. This ray falls on a strip of sensitized paper which is placed on the inside of a cylinder whose axis is perpendicular to the sun's rays. Under the diurnal motion of the sun, the ray travels across the paper, and leaves a sharp straight line of chemical action, while no other part of the paper is exposed to light. The axis of the cylinder has an adjustment for latitude. In the latest form of the apparatus two cylinders are used, one for the morning and the other for the afternoon trace.

**sun-spot** (sun'spot), *n.* One of the dark patches, from 1,000 to 100,000 miles in diameter, which are often visible upon the photosphere. The central part, or umbra, appears nearly black, though the darkness is really only relative to the intense surrounding brightness. With proper appliances the umbra itself is seen to contain still darker circular holes, and to be overlaid by films of transparent cloud. It is ordinarily surrounded by a nearly concentric penumbra composed of converging filaments. Often, however, the penumbra is unsymmetrical with respect to the umbra, and sometimes it is entirely wanting. The spots often appear in groups, and frequently a large one breaks up into smaller ones. They are continually changing in form and dimensions, and sometimes have a distinct drift upon the sun's sur-

Sun-spot of March 5th, 1873.

face. They last from a few hours to many months. They are known to be shallow cavities in the photosphere, depressed several hundred miles below the general level, and owe their darkness mainly to the absorption of light due to the cooler vapors which fill them. Their cause and the precise theory of their formation are still uncertain, though it is more than probable that they are in some way

connected with descending currents from the upper regions of the solar atmosphere. The spots are limited to the region within 45° of the sun's equator, and are most numerous in latitudes from 15° to 20°, being rather scarce on the equator itself. They exhibit a marked periodicity in number: at intervals of about eleven years they are abundant, while at intermediate times they almost vanish. The explanation of this periodicity is still unknown. Numerous attempts have been made to correlate it with various periodic phenomena upon the earth—with doubtful success, however, except that there is an unmistakable (though unexplained) connection between the spottedness of the sun's surface and the number and violence of our so-called magnetic storms and auroras.

In ML and Rom. *super-* is more confused with the related *supra-*. In words of OF. origin it appears in E. as *sur-*, as in *surprise*, *surrender*, *surround*, etc.] A prefix of Latin origin, meaning 'over, above, beyond': equivalent to *hyper-* of Greek origin, or *over-* of English origin. **2.** In *anat.* and *zool.*, upper in relative position or direction; uppermost with regard to something else: correlated with *anterior*, *inferior*, and *posterior*. The epithet was originally used in anatomical language to note the parts relatively so situated in man, and has caused much confusion in its extension to other animals, since that which is *superior* in man becomes *anterior* in most animals, and so on with the three correlated words. The tendency is now to replace these epithets with others not affected by the posture of the animal, as *cephalic*, *caudal*, *dorsal*, and *ventral*, with the corresponding adverbs ending in *-ad*.

The vague ambiguity of such terms as *superior*, *inferior*, *anterior*, *posterior*, etc., must have been felt and acknowledged by every person the least versant with anatomical description. *Dr. John Barclay, A New Anatomical Nomenclature* (1893).

**3.** In *bot.*: (*a*) Placed higher, as noting the relative position of the calyx and ovary: thus, the ovary is *superior* when the calyx is quite free from it, as normally; the calyx is *superior* when from being adnate to the ovary it appears to spring from its top. **5.** Higher or greater in respect to some quality or property; possessed or manifested in a higher (or, absolutely, very high) degree: applied to persons and things, and to their qualities and properties; surpassing others in the greatness, goodness, extent, or value of any quality; in *math.*, greater.

Sometimes used sarcastically, as of an assumed quality, without *to*: as, he smiled with a *superior* air.

Moreover, to suppose is to set up a proposition in order to trace its consequences, while imagining involves no such ulterior purpose.

It leaves the cranial cavity by the foramen rotundum of the sphenoid. (b) One of several small motor branches of the facial nerve, distributed to muscles of the superior maxillary region.

II. *n.*; pl. *supramaxillaries* (-riz). The superior maxillary, or upper jaw-bone, forming a part, in man nearly the whole, of the bony framework of the upper jaw, and representing more or less of the expanse of the cheek: correlated with *inframaxillary*. The part which the supramaxillary takes in the formation of the upper jaw mostly depends upon the relative size of the premaxillary (intermaxillary) bone. In man the latter is very small, occupying only a little space at the anterior-inferior corner of the supramaxillary, and is observable only in infancy, as it speedily ankyloses with the supramaxillary. The supramaxillary is in inverse ratio extensive, and also expansive or inflated, being entirely hollowed out by the maxillary sinus, or antrum of Highmore. It presents to the cheek an external or facial surface, with several elevations

and depressions marking the attachments of muscles, and just below the eye the large infra-orbital foramen. The posterior or zygomatic surface shows the openings of the posterior dental canals, and a rough surface for articulation with the palate bone. The superior or orbital surface forms most of the floor of the orbit of the eye. The internal or nasal surface forms much of the outer wall of the nasal meatus, and shows the opening of the antrum. Besides these surfaces, the bone has several well-marked processes, as the nasal, running up to the frontal bone, the malar, articulating with the bone of that name, the alveolar, bearing teeth, and the palatal, roofing part of the mouth. The two supramaxillary bones when together show in front a somewhat heart-shaped opening, the anterior nares, at the middle of the base of which is the prominent nasal spine, a landmark in craniometry. Each articulates with nine bones (sometimes ten), and to each twelve muscles are attached. (See cuts under *skull*, *orbit*, and *palate*.) In other mammals the supramaxillary has various shapes, and is comparatively smaller; it may always be recognized as the bone which bears the upper molar, premolar, and canine teeth—all the upper teeth excepting the incisors. In birds the supramaxillary is very greatly reduced, and often not distinctly defined: the palatal part of it is represented by a well-developed maxillopalatine; but nearly the whole of the upper beak of a bird, beyond the feathers, has for its bony basis the highly developed premaxillary. In the lower vertebrates the superior maxillary is presented under the most diverse conditions of size and shape, and is generally identified with the second bone from the front of those constituting the upper maxillary arch.

(a) A Steinerian surface. (b) The surface often originally, and better, called the *Roman surface* (discovered by Jacob Steiner (1796-1883), undoubtedly the greatest of all geometers), being a quartic surface of the third class, having three double lines in its symmetrical form its appearance is thus like a three-ribbed cone, and increases in each face to a circle. There will be of course three circles touching at the mid point of each edge of the tetrahedron, and the circle will contain on its circumference, at angular distances of 120 three mid-points, and the lines joining these with the center of the tetrahedron, produced beyond the center meet the opposite edges.—Joining the mid points. Now truncate the tetrahedron by plane

parallel to the lines, so as to reduce the altitudes, each to three-fourths of the original value, and from the center of each new face round off symmetrically up to the adjacent three circles, and within each circle scoop down to the center of the tetrahedron, the bounding surface of the excavation passing through (that is containing) the three right lines, and the sections by planes parallel to the face being in the neighborhood of the face nearly circular, but as they approach the center, assuming a trigonal form, and being close to the center an indefinitely small equilateral triangle. We have thus the surface consisting of four lobes united only by the lines through the mid points of opposite edges—these lines being consequently nodal lines, the mid points being pinch-points of the surface, and the faces singular places, each touching the surface along the inscribed circle. (*Cayley, Proceedings London Math. Soc. V 11.*)—**Surface of aberration.** the ruled surface of a star as affected by aberration.—**Surface of centers.** See *center*.—**Surface of discontinuity.** a vortex, set within a fluid over which it is slipping, the plane of the surface of equal head. $$Ax^2 + By^2 + Cz^2 - 2Dxy + 2Exz + 2Fyz = 1,$$

the coefficients are proportional to the components of a stress — **Thlipsisimetric surface**, the same as a tasinimetric surface, except that it represents a strain instead of a stress. — **Transcendental surface**, a surface which is represented in analytical geometry by a transcendental equation. — **Tubular surface**, the envelop of spheres of constant radius having their centers on a primitive curve.

In man and other mammals all the cranial bones excepting the lower jaw are united by joints technically called sutures, and in all vertebrates which have bony skulls the sutures are numerous, uniting most of the bones. Sutures are classified or described in various ways: (1) by the mode of apposition of the united surfaces or edges of the bones, as the *squamous* suture, the *harmonic* suture, the *dentate*, the *limbate*, etc. (see *synarthrosis*); (2) by the shape or position of the suture, as the *coronal*, *sagittal*, *lambdoid* suture (many of these sutures appear in the cuts under *cranium* and *skull*, and in most of the other two bones which are sutured, as the *frontoparietal*, *occipitoparietal*, *sphenoparietal* suture. See phrases following. (b) In *entom.*, the line along which the elytra of opposite sides meet and sometimes are confluent. (c) In *conch.*, the line of junction of the successive whorls of a univalve shell, or the line of closure of the opposite valves of a bivalve shell. (d) In cephalopods, the outline of the septa of the tetrabranchiates, which resemble in some respects the dentate sutures of the cranial bones. These lines are variously traced in different cases: when they are folded the elevations or saliences are called *saddles*, and the intervening depressions or reentrances are called *lobes*.

of a pericarp, there commonly marking the line of dehiscence.—4. In *surg.*: (a) The uniting of the lips or edges of a wound by stitching or stitches, or in some equivalent manner. (b) One of the stitches or fastenings used to make such a union of the lips of a wound.

(a) In *anat.*, the serrate suture between the right and left halves of the frontal bone. In adult man it is usually obliterated by confluence of the bones; when it persists, it continues the line of the sagittal suture down the middle of the forehead to the root of the nose. More accurately called *interfrontal suture*. (b) In *entom.*, same as *clypeal suture*.—**Frontoparietal suture**, the coronal suture.—**Frontosphenoidal suture**, the suture between the frontal and sphenoidal bones, chiefly the line of apposition of each orbital plate of the frontal with the corresponding orbitosphenoid.—**Genal suture**. It is noted for its irregular zigzag course and deep dentations, often including Wormian bones.—**Limbose suture**, a suture with beveled edges and toothed processes, as the coronal or frontoparietal of man.—**Mastoid suture**, the suture between the mastoid part of the temporal bone and the occipital.—**Mastoparietal suture**, the suture between the mastoid part of the temporal bone and the parietal: it is short and deeply dentated in man, and non-existent in most animals.—**Mental, metopic, nasal, neurocentral suture**. The bones thus sutured with the frontal are the ethmoid and sphenoid in mid-line, and the nasal, lacrymal, malar, and superior maxillary on each side.—**True suture**, suture by indented borders of bones, as in the dentate, serrate, and limbose sutures. A fissirostral oscine passerine bird with nine primaries; any member of the family *Hirundinidae*, of which there are numerous genera and about 100 species, found in all parts of the world. The leading species of swallows are the barn-swallows of the genus *Hirundo*, with long deeply forked tail having the lateral feathers elongated and linear toward their ends, and with lustrous steel-blue plumage on the upper parts, and more or less rufous plumage below. The common bird of Europe is *H. rustica*; that of America is *H. erythrogastra*. They are called *barn-swallows* because they usually build their nests of straw and mud on the rafters of barns. The house-swallow or martin of Europe is *H. celtica* *urbica*, of a genus not represented in America. The purple martin of North America is a very large swallow, *Progne subis* or *P. purpurea*, the male of which is entirely lustrous steel-blue; several similar species of the same genus inhabit other parts of America. The most widely diffused species of the family is the bank-swallow or sand-martin, *Clivicola* or *Cotile riparia*, common to both hemispheres, of a mouse-gray and white coloration, without luster, breeding in holes in banks. Cliff-swallows are several species of the genus *Petrochelidon*, found in various parts of the world. That of the United States is *P. lunifrons*, also called *republican swallow*, *mud-swallow*, and *eaves-swallow*. These build nests almost entirely of pellets of mud stuck together in masses on the sides of cliffs, under eaves, etc. Rough-winged swallows are several forms of the genera *Psittidoprocne* and *Stelgidopteryx*, as *S. serripennis* of the United States, having the outer web of the first primary serrate with a series of recurved hooks. It is of dull grayish coloration, resembling the bank-swallow. The white-bellied swallow of the United States is *Tachycineta* or *Iridoprocne bicolor*, of a lustrous greenish-black above and snowy-white below. A still more beautiful related species is the violet-green swallow of western North America, *Tachycineta thalassina*. The Bahaman swallow, *Callipepla* *flaviceps*, is a beautiful swallow resembling the violet-green, with sheeny upper parts and white under parts, belonging to the Bahamas and rarely found in Florida. Swallows are mainly insectivorous birds (though some of them eat berries also), and usually capture their prey on the wing with great address. Their wings are long, pointed, and narrow-bladed, giving great buoyancy, speed, and extension of flight. The feet are small and weak, and scarcely used for progression, but chiefly for perching and clinging. The song is a varied and voluble twittering, but the American martin has a strong, rich, musical note. Swallows are in most countries migratory; and those of Europe and America have long been noted, not only for the extent, but also for the regularity, of their migratory movements. Each species has its regular time of appearing in the spring, which may be predicted with much confidence; it is, however, to some extent dependent upon the weather, or the general advancement or retardation of the opening of the season. In the autumn swallows are often governed in leaving their summer resorts by the approach of storms or cold weather, and they are thus to some extent weather-prophets. Their modes of nesting are more variable than is usually the case among birds so intimately related in other habits and in structure; and swallows also show, to an extent unequalled by other birds, a readiness to modify their primitive nesting-habits in populous regions. Thus, the nidification of the seven species of swallows which are common in the United States shows four distinct categories: (1) holes in the ground, dug by the birds, slightly furnished with soft materials: bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials: white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and

by the birds, slightly furnished with soft materials: bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials: white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and

more or less furnished with soft materials by the birds: formerly no species, now six of the seven species (all excepting the bank-swallow); (4) nests elaborately constructed by the birds, plastered to natural or artificial surfaces, and loosely furnished with soft materials: the cliff-swallow and the barn-swallow, especially the former. The eggs of the swallows likewise differ more than is usual in the same family, some being pure-white, others profusely spotted. Among species in the United States, two, the barn-swallow and the cliff-swallow, lay spotted eggs; the other five, whole-colored eggs. This difference is interesting, taken in connection with the mode of breeding, since it is the general rule with birds that hole-breeders lay white eggs, and that nest-builders, especially those whose nests are elaborate and open, lay colored eggs. See also cuts under *bank-swallow*, *barn-swallow*, *eaves-swallow*, *hive-nest*, *Progne*, *rough-winged*, and *three-tailed*.

2. Some bird likened to or mistaken for a swallow. **swan**<sup>1</sup> (swon), *n.* [*ME. swan, swon*, < *AS. swan* = *MD. swaen*, *D. zwān* = *MLG. swan, swane* = *OHG. swan, m., swana, f.*, *MHG. swan, swane*, *G. schwan* = *Icel. swanr* = *Sw. swan* = *Dan. svane* = *Goth. \*swans* (not recorded), a swan; perhaps allied to *Skt. √ swan*, *L. sonare*, sound: see *sound*<sup>5</sup>. Cf. *AS. hana* = *G. hahn*, etc., a cock, as related to *L. canere*, sing: see *hen*<sup>1</sup>.] 1. A large lamellirostral palmped bird, of the family *Anatidæ* and subfamily *Cygninæ*, with a long and flexible neck, naked lores, reticulate tarsi, and simple or slightly lobed hallux. The neck is usually held in a graceful curve while the bird is swimming; the inner flight-feathers are usually enlarged, and capable of being erected or set like sails to waft the bird over the water; and in most of the species the plumage of the adults is snow-white in both sexes. The young of the white species are usually grayish or brownish; they are called *cygnets*. Swans walk awkwardly on land, in consequence of the backward position of the legs, but their movements on the water are exceptionally graceful and stately. Hence they are very ornamental, and some of them have been kept from time immemorial in a state of domestication. Swans are chiefly herbivorous. The flesh is edible, and the plumage furnishes the valuable swan's-down. There are 8 or 10 species, found in most parts of the world, except Africa. The ordinary white swans fall into two groups—*Cygnus* proper, with a knob on the beak, and *Olor*, without a knob; the latter are also distinguished by the resonant quality of the voice, due to the convolutions of the windpipe in the cavity of the breast-bone. In Europe four kinds of swans are found: (1) the common "tame" or mute swan, usually seen in domestication, *C. gibbus* (by the rules of nomenclature also

European White Swan (*Cygnus olor*).

called *C. olor*, with a knob on the beak, wedge-shaped tail, and no tracheal convolutions; (2) the elk, hooper, whooper, or whistling-swan, *Olor cygnus* or *Cygnus (O.) musicus* or *ferus*, sometimes specified as the "wild" swan; (3) Bewick's swan, *C. (O.) bewicki*; (4) the Polish swan, *C. (O.) immutabilis*. Two kinds of swans are common in North America, both belonging, like the three named last, to *Olor*: these are the whistling-swan, *C. (O.) americanus* or *columbianus*, and the trumpeter, *C. (O.) buccinator*; the former has a small yellow spot on each side of the beak, and is smaller than the latter, of which the beak is entirely black. The black-necked swan of South America

Black-necked Swan (*Sthenelides melanocoryphus*).

is *C. (Sthenelides) nigricollis* or *melanocoryphus*, with a frontal knob and the body, wings, and tail pure-white. The black swan of Australia is *Chenopsis* (usually mis-called *Chenopsis*) *atratus*, almost entirely black, with white

on the wing (some feathers of which are curly), carmine and white bill, and red eyes; it is easily acclimatized, and is often seen in domestication. A gigantic fossil swan, or swan-like goose, from the bone-caves of Malta, is known as *Palæocygnus falconeri*. The popular notion that the swan sings just before dying has no foundation in fact.

[The phrase arose at a time when only white swans were known.]

(b) See def. 1.—**Chained swan**, in *her*, a swan represented with some kind of collar about its neck, to which a chain is secured, which may be either carried to a ring or staple, or passed in a curve over the bird's neck, between its wings, or the like. The swan duceally gorged and chained is the well-known badge of the Bohuns, adopted by the Lancastrian kings.—**Demi-swan**, in *her*, a swan with only so much of the body showing as rises above the water when it is swimming, the wings either indorsed or expanded.—**Order of the Swan**, a Prussian order founded by the elector Frederick II., Margrave of Brandenburg, in 1440, renewed by Frederick William IV., King of Prussia, in 1843.—**Swan close**, in *her*, a bearing representing a swan with the wings close to its side.—**Wild swan**, any feral swan; specifically, *Cygnus ferus* (*C. musicus*): so called in distinction from the "tame" or mute swan. See def. 1.

II. *n.* A believer in the theology and religious doctrines of Swedenborg; a New Churchman. Swedenborg held Rev. xxi. 2, "And I John saw the holy city, new Jerusalem, coming down from God out of heaven," to be a prediction of the establishment of a new dispensation, the initiation of which took place by the execution of the last judgment in the spiritual world in the year 1757, whereby man was restored to moral freedom by the restriction of evil infestations, the power of which had threatened its utter extinction. In proof of this belief, his followers point to the unparalleled spiritual and material progress of mankind since that date. They were first organized in London (where Swedenborg long resided) in 1783, under the name of the "Society of the New Church signified by the New Jerusalem," usually abbreviated to New Church. Professed Swedenborgians, though widely scattered, have never been numerous; but Swedenborg himself appears not to have contemplated the formation of a separate church, trusting to the permeation of his doctrines through the existing churches. Swedenborgians believe that this process is going on, and that thus the new dispensation is making its way independently of their own organization or efforts, and even without the conscious knowledge of most of those affected by it. Swedenborg considered himself the divinely appointed herald and expounder of this dispensation, being prepared for the office by open intercourse during many years with spirits and angels (all originally human beings), and with God himself, who revealed to him the spiritual or symbolic sense of the Divine Word (which the world had not previously been in a state to receive or apprehend), setting forth spiritual and celestial truths in every part through the correspondence of all material things with the spiritual principles, good or evil, of which they are the outgrowth and manifestation. This doctrine of correspondences is the foundation of his system, which he elaborated with uniform consistency in many volumes, all first published in Latin. In this correspondence consists the plenary inspiration of the Word, which includes only the Pentateuch, Joshua, Judges, Samuel, Kings, the Prophets and Psalms, the four Gospels, and the Apocalypse; the other books of the Bible are valuable for instruction, but lack this divine character.

2. To move on or in water by natural means of locomotion, as an animal, many of which can so move, though the water be not their natural element, and swimming not their habit. The act is accomplished in many ways, by different movements of the body or of the limbs, or by various combinations of such motions. Man swims with the arms and legs, or with the legs alone, in an attitude and with an action most like that of the frog. Ordinary quadrupeds can swim with movements of the legs much like walking. Some of these are specially fitted for swimming without decided modification of structure, as the otter, the beaver, the muskrat, though often in these cases the tail takes some part in propelling or guiding the animal. Other mammals, as the pinipeds, and especially the cetaceans and sirenians, swim more or less exactly like fishes, the propulsion being mainly from the movements of the tail and hinder part of the body, and the flippers or fins being mainly used for steadying the body or guiding the course. All such mammals swim under as well as on the water. Web-footed birds, and some whose feet are scarcely or not webbed, swim on or under water, chiefly by means of the feet, but many of them accomplish a kind of flight under water with the wings, and use the feet chiefly as rudders. Such is especially the case with penguins, whose wings are flipper-like; and with the dippers (*Cinclus*), which are thrush-like birds, and fly under water as they do in the air, without using their feet at all. Aquatic serpents swim with a wriggling or writhing motion of the whole body like that with which they crawl on land; in some of these, however, the tail is flattened to serve as a fin. (See *Hydrophidie*, and cuts under *sea-serpent*, *Hydrophis*, and *Platurus*.) Aquatic anurous batrachians swim with their legs alone, when adult; their larvæ (tadpoles), and all tailed batrachians, swim like fishes, by movements of the hind part of the body and tail. Aquatic turtles swim with all four legs, and especially, in the cases of the marine forms, with their enlarged fore flippers. Nearly all crustaceans are aquatic, and swim with very variously modified limbs and tail, their natatorial organs being usually abdominal or postabdominal. (See *swimmeret*, *pleopod*, *rhinidura*.) Many insects swim by the movement of specially modified legs which serve as oars, or in the cases of larvæ by undulatory movements of the whole body; some swim only on their backs, and others float, walk, or run on the surface of the water. A few mollusks, with-

out shells, swim with an undulation of the body or of processes of the mantle, but their usual modes of swimming are unlike those of animals with ordinary limbs or tail; some swim by energetic flapping of bivalved shells, others by ejecting a stream of water through siphons, or by setting a sort of sail which wafts them over the water. Aquatic worms swim by wriggling the whole body, and also by the action of multitudinous parapods or cilia. Jellyfishes and comb-jellies swim by rhythmical pulsations of a swimming-bell, or of the whole body, assisted or not by the action of some special organs. Animals swim mainly by ciliary action, but also by changes in the shapes of their bodies, and in some cases by special formations. See *swimming-bell*, *bladder*, *fin*, *foot*.

An ungulate non-ruminant quadruped, of the family *Suidæ* in a broad sense; any hog, pig, sow, or boar; in the plural, these animals collectively. The word is commonly used in the plural, *swine*, as a collective noun, meaning several individuals of a given species, as of the domestic hog, or several kinds of swinish animals, as the hog, the wart-hog, the peccary, the babirusa, etc. The most important breeds of swine are those originated in England during the present century. Some have been produced by crossing native hogs with China and Italian (Neapolitan) breeds. Among the most prominent are the following: the Berkshires, black pigs, with white on the feet, face, tip of the tail, and occasionally on the arm, and erect ears of medium size; the Essex, black pigs of small to medium size, with small ears at first erect, later drooping; and the Yorkshires, a well-established breed of large and small hogs of white color, resembling the Suffolk breed, also with white skin and small upright ears. Neapolitans represent a breed of rather small Italian swine, seldom bred in the United States. They are described as having a bluish-plum or slaty color, the skin nearly free from hair, and the ears small, standing forward horizontally. The English varieties, especially the Berkshires, are largely bred in the United States, where are also raised a number of native breeds. The Poland-China originated during the present century in Ohio from several breeds, including some so-called China hogs. They are characterized by a dark spotted or black color, small, broad, slightly concave face, and fine, drooping ears. The Duroc-Jersey, of unknown origin, has been bred in New Jersey for many years; they are large red animals with lopped ears. The Chester White originated in Chester county, Pennsylvania. Cheslures and Victorias are white swine, originating in New York State, which do not represent distinct breeds. **swine-plague** (swin'pläg), *n.* An infectious disease of swine, appearing in more or less extensive epizootics, in which usually most of the animals exposed to the infection succumb. The disease is caused by specific bacteria, and is localized in the lungs, giving rise to pneumonia and pleurisy. The digestive tract may be secondarily involved. In such cases diphtheritic inflammation of the mucous membrane of the large intestine is present. Swine-plague is not readily distinguished from hog-cholera. In the latter disease the lesions, chiefly limited to the large intestine, are in the form of round button-shaped ulcers and diphtheritic patches. Lung-disease is slight or absent. The specific bacteria causing hog-cholera are readily distinguished from those of swine-plague, and upon this distinction the diagnosis is mainly based. The introduction of diseased swine into a herd is probably the main cause of the spreading of both maladies.

Scott, Heart of Mid-Lothian, xxvi.

2. A mechanical device for shifting a moving body, or a current of electricity, etc., from one course or track to another. Specifically — (*a*) In railroads, in its simplest form, two parallel lengths of rails joined together by rods, pivoted at one end, and free to move at the other end, forming a part of the track at its junction with a branch or siding. The switch-rails rest on metal plates laid on the sleepers, and, by means of a rod fastened to their free ends, can be moved sidewise. The ends of the next pair of rails and the ends of the first pair of the siding or branch are placed side by side, so that by the movement of the switch either pair may be brought in line with the track, and any car or engine passing the switch will be guided upon the rails to which the switch is directed. Such a switch may be used to connect several lines of rails. The objection to this form of switch is that a car moving on a track not connected with the switch is liable to be derailed by running off the open ends of the track. This has led to the adoption of safety-switches, of which there are various forms. One of the most common of these is the *split switch*, in which the ends of the rails, instead of being square, are drawn out (split) to a thin edge so as to lie close against the side of the next rail. The narrow rails used are flexible and are fitted with springs, so that in the event of a displacement of the switch the lateral pressure of the wheels will cause the points to move back and thus keep the wheels on the line, the points returning to their original position by the recoil of the springs. Another form of safety-switch is designed to keep unbroken the

track of the main line, so that the main-line rails are not cut at all. To use this form of switch the levers are moved, and the car rises on an inclined rail and passes over the main rails to the siding. A great number of devices have

Figs. 1 and 2. Point-switches, or Split Switches. Fig. 3. Stub-switch. Fig. 4. Double-slip switch. Fig. 5. Section of Fig. 1. *a, a*, main tracks; *b, b*, branch tracks, or sidings; *c, c*, single frogs; *c', c'*, double frogs; *d*, switch bar or rod (that nearest the point is called the *front rod*); *e*, switch-stand, with butterfly-signal and lamp. In Fig. 4 the switches are shown as arranged at a crossing for shifting a train from one track to another in either direction. The outer rails in point-switches are full rails and rigidly spiked to the ties, while the inner are movable and taper to a point (whence the term *split*, as applied to them, is derived). In stub-switches the rails are full, and the rails of the main track adjacent to the branch as well as the branch rails, are rigid, while the movable rails are on that part of the main track which meets the branch. The double-slip switch is simply composed of four point switches.

been invented to make switches more safe, to render them automatic (as at the terminus of a line where the engine is to be shifted to the other end of a train), to render them interlocking, so that no one switch of a system can be opened without locking all others, and to connect them with signals and annunciators. Switches in one yard are now commonly controlled by means of long levers with a central tower from which one switchman can see and control them all. (b) In *teleg.*, a device used to make or break a circuit, to join two lines of wire or a main wire with a branch wire, or to connect any telegraph, telephone, electric-light, or electric-signal wires in any manner. The most simple form of switch is a lever pivoted at one end and connected with one circuit, and, by its movement laterally, used to connect that circuit with one of several others. Another simple form, called the *plug*- or *peg-switch*, consists of a metal plug or peg that may be inserted in openings or spaces between metal rods connected with different circuits. The peg serves as a bridge to join different circuits. The peg may also be connected with a short piece of flexible wire, the wire serving as a bridge for the current. By moving the peg from place to place on the switch-board, the wire serves as a switch to divert the current from one line to another. See *switchboard*.

(*a*) According to ancient writers, it originally applied to 'one who informed on another for the exporting of figs from Attica' (which is said to have been forbidden); or (*b*) to 'one who informed on another for plundering sacred fig-trees'; (*c*) a third explanation makes it orig. 'one who brings figs (hidden in the foliage) to light by shaking the tree,' hence 'one who makes rich men yield tribute by means of false accusations.' All these explanations are doubtless inventions. (*d*) The real explanation appears to lie in some obscure use of *σῖκος*, fig, this word, and the *L. ficus*, fig, with its Rom. forms, being found in various expressions of an obscene or abusive nature. This origin, whatever its particular nature, would explain the fact, otherwise scarcely explicable, that the original application of the term is without record.] *I. n. 1†*. *Holland*, tr. of *Plutarch's Morals*, p. 261. (*Trench.*)

This ordinance is in the first table of Solon's laws, and therefore we may not altogether discredit those which say they did forbid in the old time that men should carry figs out of the country of Attica, and that from thence it came that these pick-thanks, which bewray and accuse them that transported figs, were called *sycophants*.

*North*, tr. of *Plutarch*, p. 77.

The laws of Draco . . . punished it [theft] with death; . . . Solon afterwards changed the penalty to a pecuniary mulct. And so the Attic laws in general continued, except that once, in a time of dearth, it was made capital to break into a garden and steal figs; but this law, and the informers against the offence, grew so odious that from them all malicious informers were styled *sycophants*: a name which we have much perverted from its original meaning. *Blackstone*, Com., IV. xvii.

**syenite** (si'e-nit), *n.* [*< L. syenites*, sc. *lapis*, lit. 'stone of Syene,' *< Syene*, *< Gr. Συήνη*, a locality of upper Egypt.] A rock composed of feldspar and hornblende, with or without quartz. The name *syenite* was given by Pliny to the red granite rock extensively quarried at Syene in Egypt. The term *syenite* was introduced into modern geological science by Werner, in 1788, but applied by him to a rock (from the Plauenscher Grund, near Dresden) not identical in composition with the *syenites* of Pliny, which latter is a hornblende granite, or granite in which mica is replaced by hornblende, whereas the rock which Werner called *syenite* is mainly made up of a mixture of feldspar and hornblende; hence there has long been more or less confusion in regard to the nomenclature of this rock. The English and some continental geologists have defined syenite as an aggregate of quartz, feldspar, and hornblende; while the Germans have generally regarded the quartz as not being an essential constituent of the rock: this latter view is that which has been adopted in the most recent English geological and lithological works. Syenite is a rock thoroughly crystalline in texture, and in general it much resembles granite in its mode of occurrence. The feldspar in this ingredient is chiefly orthoclase, and this usually predominates considerably in quantity over the associated minerals; there is some trichite feldspar present, however, in most syenites, and the same is true in regard to quartz, biotite, titanite, magnetite, apatite, zircon, and various other accessory minerals frequently found in small quantity in the granitic rocks. Sometimes the hornblende is replaced by augite; this variety is designated *avante-syenite*; that in which mica predominates is known as *mica-syenite* or *minette*. The range of syenite in geological age is similar to that of granite, and the frequent passage of one rock into the other shows how closely allied the two are, one result of which condition is that the nomenclature of the different varieties is correspondingly difficult. Typical syenite is by no means abundant, and in general the granitic rocks very considerably surpass the syenitic in economic importance. Also *syenite*.

**syenitic** (si'e-nit'ik), *a.* [*< syenite + -ic*.] Containing syenite; resembling syenite, or possessing some of its properties. Also *syenitic*. — **Syenitic granite**, granite which contains hornblende. — **Syenitic porphyry**, fine-grained syenite containing large crystals of feldspar.

**syllabication** (si-lab-i-kā'shon), *n.* [*< syllabicate + -ion*.] The formation of syllables; especially, the division of a word into its constituent syllabic parts in writing and printing. The division of a word of more than one syllable into separate syllables is in great measure an artificial process, since a consonant intervening between two vowels is usually (see under *syllable*) to be reckoned as belonging to either one of them not less properly than to the other. This is especially true of the continuant consonants, the semivowels

and the fricatives (thus, *follow*, *arrow*, *ever*, *lesser*, *ashes*, etc.); a mute, particularly a surd mute (*p*, *t*, *k*), has more claim to go with the following vowel, because a mute is much more distinctly audible upon a following than after a preceding vowel (in *tea* than in *ate*). We tend also to reckon such a consonant to the vowel of whose force and pitch it seems most to partake; and, along vowel being regularly a diminuendo utterance, the strength of impulse falling off before it is ended, a following consonant seems naturally to belong to the vowel that succeeds (so *dai-ly*, *ci-ther*, *ea-sy*, etc.); on the other hand, a consonant of any kind after a short accented vowel so shares the latter's mode of utterance as to be naturally and properly combined with it: thus, *bit-er* (*bitter*), *tak-er* (*tackle*), *hon-est*, etc. When two or more actually pronounced consonants come between vowels, it makes a difference whether they are or are not such as readily in our practice combine as initials before a vowel: thus, as we say *ply*, we divide *supply* into *su-ply*, not *sup-ly*; but *subject* only into *sub-ject*. As for syllabication in printing (when a word has to be broken at the end of a line), that is a different and more difficult matter, partly because many silent consonants (especially in the case of doubled consonants) have to be dealt with; it also pays much regard to the history of a word, dividing this generally, so far as possible, into the parts of which it is etymologically composed; and it has some arbitrary and indefensible usages, such as the invariable separation of *-ing*, by which we get such offenses against true pronunciation as *rag-ing*, *fac-ing*, instead of *ra-ging*, *fa-cing*; and even *mix-ture*, *junct-ure*, instead of *mix-ture*, *junc-ture*, owing to the notion that *-ure* rather than *-ture* is the ending.

**syllabification** (si-lab'i-fi-kā'shon), *n.* [*< syllabify + -ation*.] Same as *syllabification*.

**syllabify** (si-lab'i-fi), *v. t.*; pret. and pp. *syllabified*, ppr. *syllabifying*. [*< L. syllaba*, syllable (see *syllable*), + *facere*, make, do: see *-fy*.] To syllabicate.

**syllabism** (sil'ā-bizm), *n.* [*< L. syllaba*, syllable, + *-ism*.] Theory of or concerning syllables; also, syllabic character; representation of syllables.

In addition to these vestiges of a prior syllabism, a few ideographic characters are retained, as in the Proto-Medic syllabary, to designate certain frequently recurring words, such as king, country, son, name, and Persian.

**syllable** (sil'ā-bl), *n.* [Formerly also *sillable*, *syllabe*, *syllab*; *< ME. sillable*, *< OF. syllable*, *sillable* (with unorig. *-le*, as in *principle*, etc.), prop. *syllabe*, *syllabe*, *< OF. syllabe* = *F. syllabe* = Sp. *silaba* = Pg. *syllaba* = It. *silaba* = G. *silbe*, *< L. syllaba*, ML. also *sillaba*, *< Gr. συλλαβή*, a syllable, several sounds or letters taken or joined together, lit. a taking together, *< συλλαβάναι*, take together, put together, *< σίλω*, with, together, + *λαμβάνειν*, *λαμβάνω*, take.] 1. The smallest separately articulated element in human utterance; a vowel, alone, or accompanied by one or more consonants, and separated by these or by a pause from a preceding or following vowel; one of the successive parts or joints into which articulated speech is divided, being either a whole word, composed of a single vowel (whether simple or compound) with accompanying consonants, or a part of a word containing such a vowel, separated from a preceding or following vowel either by a hiatus (that is, an instant of silence) or, much more usually, by an intervening consonant, or more than one.

Syllables are the separate successive parts into which the ear apprehends the continuous utterances of speech as divided, their separateness consisting mainly in the alternation of opener and closer elements, or vowels and consonants. A normal syllable is a vowel utterance attended with subsidiary consonantal utterances. As to what sounds shall have vowel value in syllable-making, different languages differ; English allows, besides those usually called vowels, also *l* and *n*, as in *reckon* (reck-n), *reckoned* (reck-n), *riddle* (rid-l), *riddles* (rid-lz). If the vowel is attended by both sonant and sord consonants, the sonant are in general nearer it, as in *print*, *stir*; and also, as in the same words, the opener sounds are nearer it than the closer. But the intricacy of construction of English syllables is tolerated by but few languages; and many (as the Polynesian) will bear nothing more than a single consonant to a vowel, and that one only before it. The assignment of a consonant or of consonants in syllabication to the preceding or the following vowel is in great part a matter of convention, depending on no real principle: thus, in *alley*, for example, the *l* is a division between the two vowels, like a wall between two fields, belonging to one no more than to the other. It is on syllabic division that the "articulate" character of human speech depends. (See *articulate*. Also compare *vowel* and *consonant*.) In prosody syllables are classed as *long*, *short*, and *common* (see these adjectives). See also *time*.

Its full title is: A *Syllabus*, containing the Principal Errors of our Times, which are noted in the Consistorial Allocations, in the Encyclicals, and in other Apostolical Letters of our Most Holy Lord, Pope Pius IX. . . . It is divided into ten sections. The first condemns pantheism, naturalism, and absolute rationalism; the second, moderate rationalism; the third, indifferentism and latitudinarianism; the fourth, socialism, communism, secret societies, Bible societies, and other "pests of this description"; the fifth, errors concerning the Church and her rights; the sixth, errors concerning civil society; the seventh, errors of natural and Christian ethics; the eighth, errors concerning Christian marriage; the ninth, errors concerning the temporal power of the pope; the tenth, errors of modern liberalism. Among the errors condemned are the principles of civil and religious liberty, and the separation of Church and State.

P. Schaff, in Johnson's Univ. Cyc., IV. 638.

**syllepsis** (si-lep'sis), *n.* [= F. *syllepse*, < L. *syllepsis*, < Gr. *σύν* + *λέγω*, a taking or putting together, comprehension, < *σύν* + *λαμβάνειν*, take together: see *syllable*.] In *rhet.* and *gram.*:

(a) A figure by which a word is used in the same passage both of the person to whom or the thing to which it properly applies, and also to

include other persons or things to which it does not apply properly or strictly. This figure includes zeugma and also the taking of words in two senses at once, the literal and the metaphorical, as in the following passage, where the word *sweeter* is used in both senses: "The judgments of the Lord are true and righteous altogether; . . . sweeter also than honey and the honey-comb." (Is. xix. 9, 10.) Also sometimes used as equivalent to *synesis*.

If such want be in sundrie clauses, and of severall congruities or sence, and the supply be made to serve them all, it is by the figure *Sillepsis*, whom for that respect we call the [double supply].

Puttenham, *Arte of Eng. Poesie*, p. 137.

(b) A figure by which one word is referred to another in the sentence to which it does not grammatically belong, as the agreement of a verb or an adjective with one rather than another of two nouns with either of which it might agree: as, *rex et regina beati*.

**sylleptic** (si-lep'tik), *a.* [*< syllepsis* (-lept-) + -ic.] 1. Containing or of the nature of syllepsis. *Imp. Dict.*—2. Explaining the words of Scripture so as not to conflict with modern science.

**sylleptical** (si-lep'ti-kal), *a.* [*< sylleptic* + -al.] Same as *sylleptic*. *Imp. Dict.*

**sylleptically** (si-lep'ti-kal-i), *adv.* By way of syllepsis. *Imp. Dict.*

**syller**, *n.* See *sylter*.

**Syllidæ** (sil'i-dæ), *n. pl.* [NL., < *Syllis* + -idæ.]

A family of errant marine worms, typified by the genus *Syllis*, and containing also the genera *Grubea*, *Dujardinia*, and *Schmardia*. Among these worms both sexed and sexless forms occur; and such heteromorphism is associated with a mode of propagation by the spontaneous division of an asexual individual into two or more parts, which may severally become sexual persons. Many of the species are phosphorescent. See cut under *Autolytus*.

**syllidian** (si-lid'i-an), *n.* A worm of the family *Syllidæ*.

**Syllis** (sil'is), *n.* [NL. (Savigny).] A genus of polychæatus annelids, typical in some systems of the family *Syllidæ*. *Autolytus* is a synonym.

**sylloge** (sil'ô-gê), *n.* [*< Gr. συλλογή*, a gathering, summary (cf. *συλλογος*, an assembly, course), < *σύν* + *λέγω*, gather together: see *syllogism*.] A collection.

Of the documents belonging to the later period a very comprehensive though not quite complete *sylloge* is given. *Encyc. Brit.*, XIII. 131.

**syllogisation**, **syllogise**, etc. See *syllogization*, etc.

**syllogism** (sil'ô-jizm), *n.* [Formerly also *sillogism*, *silogisme*; < ME. *sillogisme*, *silogisme*, < OF. *syllogisme*, *silogisme*, F. *syllogisme* = Sp. *silogismo* = Pg. *syllogismo* = It. *silogismo*, *silogismo*, < L. *syllogismus*, < Gr. *σύν* + *λογισμός*, a reckoning all together, a reasoning, a conclusion, < *σύν* + *λογίζεσθαι*, bring together premises, infer, conclude, < *σύν*, together, + *λογίζεσθαι*, reason, < *λόγος*, word, something spoken: see *Logos*.] 1. A logical formula consisting of two premises and a conclusion alleged to follow from them, in which a term contained in both premises disappears: but the truth of neither the premises nor the conclusion is necessarily asserted. This definition includes the *modus ponens* (which see, under *modus*), the formula of which is that from the following from an antecedent of a consequent, together with the antecedent, follows the consequent. This depends upon two principles—first, the principle of identity, that anything follows from itself; and, secondly, the principle that to say that from A it follows that from B follows C is the same as to say that from A and B follows C. Under the former principle comes the formula that the following from an antecedent of a consequent follows from itself, and this, according to the second principle, is identical with the principle of the *modus ponens*. But the syllogism is often restricted to those formula which embody the *nota nota* (or *maxim*, *nota nota est nota rei ipsius*), which may be stated under the form—*from the following of anything from a consequent follows the following of the same thing from the antecedent of that consequent*. Under this form it is the principle of contraposition. The simplest possible of such syllogisms is like this: Enoch was a man; hence, since being mortal is a consequence of being a man, Enoch was mortal. All syllogisms except the *modus ponens* involve this principle. A syllogism which involves only this principle, and that in the simplest and directest manner, like the last example, is called a *syllogism in Barbara*. In such a syllogism the premise enunciating a general rule is called the *major premise*, while that which subsumes a case under that rule is called the *minor premise*. A syllogism whose cogency depends only upon what is within the domain of consciousness is called an *explicatory* (or *analytic*) *syllogism*. A syllogism which supposes (though only problematically) a generalizing character in nature is called an *ampliative* (or *synthetic*) *syllogism*. (See *explicative inference* (under *inference*), and *induction*, 6.) Analytic syllogisms are either necessary or probable. Necessary syllogisms are either non-relative or relative. Non-relative syllogisms are either categorical or hypothetical, but that is a trifling distinction. They are also either direct or indirect. A direct syllogism is one which applies the principle of contraposition in a direct and simple manner. An indirect syllogism is either

## syllogism

minor or major. A minor indirect syllogism is one which from the major premise of a direct (or less indirect) syllogism and a consequence which would follow from its conclusion infers that the same consequence would follow from the minor premise. The following is an example: All men are mortal; but if Enoch and Elijah were mortal, the Bible errs; hence, if Enoch and Elijah were men, the Bible errs. A major indirect syllogism is one which from the minor premise of another syllogism and a consequence from the conclusion infers that the same thing would follow from the major premise. Example: All patriarchs are men; but if all patriarchs die, the Bible errs; hence, if all men die, the Bible errs. Such inversions may be much complicated: thus, No one translated is mortal; but if no mortals go to heaven, I am much mistaken; hence, if all who go to heaven are translated, I am much mistaken. To say that from a proposition it would follow that I err when I know I am right would amount to denying that proposition, and, conversely, to deny it positively would amount to saying that, if it were true, I should be wrong when I know I am right. A denial is thus the precise logical equivalent of that consequence. An indirect syllogism in which the contraposition involves such a consequence is said to be of the second or third figure, according as its indirection is of the minor or major kind. The fourth figure, admitted by some logicians, depends upon contraposition of the same sort, but more complicated, like the last example. The first figure comprises, in some sects of logic, the direct syllogism only; in others, the direct syllogisms together with those which are otherwise assigned to the fourth figure. (See *figure*, 9.) The names of the different varieties, called *moods of syllogism*, are given by Petrus Hispanus in these hexameters:

Barbara: Celarent: Darii: Ferio: Baralip-ton:  
Celantes: Dabitis: Fapesmo: Friesomorum.  
Cesare: Camestres: Festino: Baroco: Darapti:  
Felapton: Disamis: Datisi: Bocardo: Ferison.

(See these words, and *mood*, 2.) Probable deductive syllogisms are really direct statistical inferences (which see, under *inference*). The following is an example: In the African race there are more female than male births; the colored children under one year of age in the United States at the time of the census of 1880 form a random sample of births of Africans; hence, there should be more females than males under one year of age among the colored population of the United States in 1880. The conditions of the validity of such a syllogism are two: first, the character forming the major term (here that of the relative numbers of females and males) must be taken at random—that is, it must not be one which is likely to be subject to peculiar uniformities which could affect the conclusion; second, the minor term, or sample taken, must be numerous and a random sample—that is, not likely to be of a markedly different character from that which is general in the class sampled. The conclusion is probable and approximate—that is, the larger the sample is the smaller will be the probable error of the predicted ratio. Synthetical or ampliative syllogisms are indirect probable syllogisms. The major indirect probable syllogism is induction (which see). The following is an example: The colored children under one year of age in the United States in 1880 form a random sample of births of Africans; but if there ought to have been more males than females among those children, the colored population of the United States is very different from the bulk of Africans; hence, if in the African race in general there are more male than female births, the colored population of the United States is very different from the bulk of Africans. It must be remembered that an observation of a ratio is never exact, but merely admits some values and excludes others; its denial excludes the former, and admits the latter. The denial of a statistical rule is thus itself a statistical rule; and hence such forms as the following are indirect probable syllogisms: American colored children under one year of age in 1880 form a sample of African births; among these the females are in excess; hence, in African births generally the females are probably in excess. The minor indirect probable syllogism is hypothetic inference. (See *hypothesis*, 4.) Relative syllogisms are those which involve other than merely transitive relations. These were first studied by De Morgan, and afterward by an American logician, but were involved in much difficulty until another American student, O. H. Mitchell, furnished in 1882 the clue to their unravelment. Every relative syllogism has at its core a non-relative syllogism, but this is generalized in a peculiar way—namely, every relative term refers to two or more universes, which may be coextensive, or may be entirely unlike as universes of material things, of space, of time, of qualities, etc. A relative proposition refers to some or all of each of several universes, and the order of the reference is material. (See *proposition*, 3.) Transpositions, identifications, and diversifications are performed upon principles now clearly made out. An important circumstance in regard to relative syllogism is that the same premise may be repeatedly introduced with new effect. Among relative syllogisms are comprised all the elements of mathematical reasoning, especially the Fermatian inference, the syllogism of transposed quantity, and the peculiar reasoning of the differential calculus.

**sylph** (silf), *n.* [= *D. sylpha*, *silfe* = *G. sylphe* = *Dan. sylfe* = *Sw. sylfe*, *cf. F. sylphe* = *Sp. silfo* = *Pg. sylpha*, *cf. NL. sylpha*, a fictitious name, found in Paracelsus, appar. *cf. Gr. εἶδος*, a kind of beetle. Other names of elemental spirits (*nymph, gnome, salamander*) are taken from the Gr., only one (*nymph*) having such use in Gr., the others being, like *sylph*, arbitrary. The spelling *sylph* (*NL. sylpha*), with *y* instead of *i*, seems to have been used to make it look more like *nymph*, and because to occultists and quacks like Paracelsus words spelled with *y* look more Greek and convincing. As *salamander*, orig. 'a kind of lizard supposed to live in fire,' was made, by an easy transfer, to mean 'a

spirit of fire,' and *gnome*, quite arbitrarily (see *gnome*), was made to mean 'a spirit of earth,' so *sylph*, orig. (in the Gr. *αἶψα*) 'a beetle or insect,' seems to have been taken as 'a light flying creature,' hence 'a spirit of the air.' According to Littré the name was based on an Old Celtic word meaning 'genius,' given in the Latinized plural forms *sulph, sylph, sylphi, m., sulera, sulerae, f.* 1. An imaginary being inhabiting the air; an elemental spirit of the air, according to the system of Paracelsus, holding an intermediate place between material and immaterial beings. Sylphs are male and female, have many human characteristics, and are mortal, but have no soul. The term in ordinary language is used as feminine, and often applied figuratively to a young woman or girl of graceful and slender proportions.

I should as soon expect to meet a nymph or a sylph for a wife or a mistress. *Sir W. Temple*.

2. In *ornith.*, one of various humming-birds with long forcinate tail; so called from their grace and beauty; as, the blue-tailed sylph, *Cyananthus forficatus*. See *cut* under *sappho*.—*Syn.* 1. *El. Fay*, etc. See *fairy*.

**Sylpha**, *n.* In *entom.*, a variant of *Silpha*. **sylphid** (sil'fid), *n.* [= *D. silfide* = *G. sylphide* = *Sw. sylfid* = *Dan. sylfide*, *cf. It occurs crystallized and massive, of a steel-gray to silver-white color and brilliant metallic luster. The crystals are often so arranged in parallel position on the rock surface as to resemble written characters; it is hence called *graphic tellurium* or *graphic gold*.

**sylvato** (sil'vat), *n.* [*cf. sylve + -ate*.] A salt of sylvic acid.

**Sylvia** (sil'vi-â), *n.* [*NL.* (Scopoli, 1769), also *Silvia* (Cuvier, 1800), *cf. L. silva*, *silva*, a wood, a forest.] 1. In *ornith.*: (a) A genus of small denitrostral or turdoid oscine passerine birds, typical of the family *Sylviidae*; the warblers proper. This genus was originally constituted for a part of the Linnean genus *Metacilla*, and has been loosely used for several hundred small warbler-like birds of both hemispheres, now dissociated in different families. The name is commonly attributed to Latham (1790), but was first used by Scopoli in 1769. The type is now assumed to be the common whitethroat, *Metacilla sylvia* of Linnaeus, *Sylvia cinerea* of Bechstein, also called *S. rufa*; and the term is restricted to a few very closely related species of chiefly Palearctic warblers, of small size, with scutellate tarsi, bristled gape, twelve tail-feathers, axillaries never yellow, first primary spurious, and the bill strictly sylvine. Some of the leading species in this narrow sense are *S. natterii*, the barred warbler; *S. hortensis*, the peewee; or garden-warbler (see *cut* under *peewee*); *S. curruca*, the lesser whitethroat; *S. atricapilla*, the blackcap; *S. arctica*, the orpington warbler. These, like *S. cinerea*, are all found in Great Britain. No bird of this genus occurs in America, though most of the American warblers which were known to the older ornithologists were placed in *Sylvia*. (b) [*L. e.*] A warbler; a species of the genus *Sylvia*, or some similar bird.—2. In *entom.*: (a) A genus of dipterous insects. *Descoyds*, 1830. (b) A genus of arachnids. *Gerrais*, 1849.

*II. n.* One of the warblers; a member (a) of the genus *Sylvia* or family *Sylviidae* of the Old World, or (b) of the family *Mniotiltidae* of America. See these words, and *warbler*.

**Sylvian** (sil'vi-an), *a.* [*cf. Sylvius* (see *def.*) + *-an*.] Relating or named from the anatomist Jacques Dubois, Latinized *Sylvius* (1478–1555); specifically applied in anatomy to several parts.—**Sylvian aqueduct**. See *aqueductus Sylvii*.—**Sylvian artery**, the middle cerebral artery, lying in the Sylvian fissure.—**Sylvian fissure or sulcus**. Same as *fissure of Sylvius* (which see, under *fissure*). It is the most marked and persistent of all the fissures, recognizable in some animals the surface of whose cerebrum is otherwise perfectly smooth; in man it is very deep, and incloses the island of Reil, or insula constituted by the gyri operculi. The name is sometimes restricted to the posterior or horizontal branch of the fissure, or that part which is commonly present in other animals than man.—**Sylvian ventricle**, the camera, pseudocula, or so-called fifth ventricle of the brain.

**sylvic** (sil'vik), *a.* [*cf. L. silva*, less prop. *silva*, a wood, forest, + *-ic*.] Pertaining to or derived from wood.—**Sylvic acid**, one of the acids obtained from colophony; same as *abietic acid*. See *abietic*.

**Sylvicola** (sil-vik'ô-lî), *n.* [*NL.*, *cf. L. silvicola*, *silvicola*, inhabiting woods, *cf. silva*, a wood, + *colere*, inhabit.] 1. In *entom.*, a genus of dipterous insects. *Harris*, 1782.—2. In *conch.*, a genus of pulmonate gastropods, of the family *Helicidae*. *Humphreys*, 1797.—3. In *ornith.*: (a) A genus of American warblers, proposed by Swainson in 1827, for many years in use, and giving name to the family *Sylviicolidae*. It was based upon the blue yellow-backed warbler, *S. americana*, subsequently made the type of the genera *Chloris* (Ble, 1826), *Parula* (Bonaparte, 1838), and *Compsothlypis* (Cabanis, 1850), and generally applied to the species of *Dendroica* and some related genera before the recognition of the fact that the name was preoccupied. It fell into disuse about 1842, and the name of the family has since been changed to *Mniotiltidae* or *Dendroica*. See these family names. (b) A genus of Old World warblers, based by Eyton upon *Sylvia sylvicola*, the wood-warbler, now known as *Phylloscopus sibilatrix*.

**Sylvicolæ** (sil-vik'ô-lî), *n. pl.* [*NL.*, pl. of *Sylvicola*, q. v.] In *ornith.*, in Sundevall's system, a synonym of *Duodecimpennatæ*.

The limits of the family, like those of its representative genus, have fluctuated widely, and no exclusive diagnosis is practicable. As compared with *Turdidæ*, the *Sylviidæ* differ in the usually unspotted plumage of the young birds, which differ little from the adults. Compared with *Mniotiltidæ*, the *Sylviidæ* lack the breadth and flatness of the bill which characterize the true flycatchers, and the great development of the rictal bristles. The family is very widely distributed in the eastern hemisphere, but is scarcely represented in America, where the birds formerly classed as *Sylviidæ* are, with very few exceptions, *Mniotiltidæ*, having but nine primaries and being otherwise quite different. The *Sylviidæ* include many modern genera, and are variously subdivided. In one classification they are made to consist of 7 subfamilies—*Drymaceinæ*, *Calamherpinæ*, *Phylloscopinæ*, *Sylviinæ*, *Ruticillinæ*, *Saxicolinæ*, and *Accentorinæ*. There were many bends in it [the avenue at Karnak], but the fact affords no fresh proof of Egyptian *symmetrophobia*. *Miss A. B. Edwards, tr. of Maspero's Egypt*. (*Archæol.* 1887), p. 86.

**symmetry** (sim'e-tri), *n.* [Formerly also *symmetrie*, *symmetric*; < *OF. symmetrie*, *F. symétrie* = *Sp. simetría* = *Pg. simetria* = *It. simetria*, *simmetria* = *D. simmetrie* = *G. symmetrie* = *Sw. Dan. symmetri*, < *L. symmetria*, < *Gr. συμμετρία*, agreement in dimensions, arrangement, etc., due proportion, < *συμμετρος*, having a common measure, commensurate, even, proportionate, moderate, in due proportion, symmetric, < *σύν*, with, + *μέτρον*, measure.] 1. Proportionality; commensurability; the due proportion of parts; especially, the proper commensurability of the parts of the human body, according to a canon; hence, congruity; beauty of form. The Greek word *συμμετρία* was probably first applied to the commensurability of numbers, thence to that of the parts of a statue, and soon to elegance of form in general.

**2.** The metrical correspondence of parts with reference to a median plane, each element of geometrical form having its counterpart upon the opposite side of that plane, in the same continued perpendicular to the plane, and at the same distance from it, so that the two halves are geometrically related as a body and its im-

age in a plane mirror: so, usually, in geometry. Especially, in *arch.*, the exact or geometrical repetition of one half of any structure or composition by the other half, only with the parts arranged in reverse order, as notably in much Renaissance and modern architecture—for instance, in the placing of two spires, exact duplicates of each other, on the front of a church. Such practice is very seldom followed in the best architecture, which in general seeks in its designs to exhibit harmony (see *harmony*, 9), but avoids symmetry in this sense.

We have an Idea of *Symmetry*; and an axiom involved in this Idea is that in a symmetrical natural body, if there be a tendency to modify any member in any manner, there is a tendency to modify all the corresponding members in the same manner.

Whewell, *Philos. of Inductive Sciences*, I. p. xxx.

John and Jeremiah sat in *symmetry* on opposite sides of the fireplace; the very smiles on their honest faces seemed drawn to a line of exactitude.

Mrs. Gaskell, *Sylvia's Lovers*, xiv.

3. The composition of like and equably distributed parts to form a unitary whole; a balance between different parts, otherwise than in reference to a medial plane: but the mere repetition of parts, as in a pattern, is not properly called *symmetry*.—4. Consistency; congruity; keeping; proper subordination of a part to the whole.

It is in exact *symmetry* with Western usage that this great compilation was not received as a code until the year 1309. *Stubbs, Medieval and Modern Hist.*, p. 167.

5. In *biol.*: (a) In botany, specifically, agreement in number of parts among the cycles of organs which compose a flower. See *symmetrical*, 3. (b) In zoölogy and anatomy, the symmetrical disposition or reversed repetition of parts around an axis or on opposite sides of any plane of the body. *Symmetry* in this sense is something more and other than that due proportion of parts noted in def. 1, since it implies a geometrical representation approximately as in def. 2 (see *promorphology*); it is also to be distinguished from mere metamorphism, or the serial repetition of like parts conceived to face one way and not in opposite directions; but it coincides in some cases with *actinomerism*, and in others with *antimerism* or *platetropy* (see *antimerism*, *platetropy*). Several sorts of symmetry are recognized. One is *radial* or *actinomerism*, in which like parts are arranged about an axis, from which they radiate like the parts of a flower, as in many zoophytes and echinoderms; but such symmetry is unusual in the animal kingdom, being mainly confined to some of the lower classes of invertebrates, and even in these the departures from it are frequently obvious. (See *bicrium*, *tridium*, and cuts under *echinopodium* and *Spatangoides*.) The tendency of animal form on the whole being to grow along one main axis (the longitudinal), with symmetrical duplication of parts on each side of the vertical plane (the meson) passing through that axis, it follows that the usual symmetry is *bilateral* (see below). This is exhibited only obscurely, however, by some cylindrical organisms, as worms, whose right and left "sides," though existent, are not well marked; and to such symmetry of ringed or annulose forms the term *zonal* is sometimes applied. When the ordinary metamorphic divisions of any animal, as a vertebrate or an arthropod, are conceived as not simply serial but also as antitropic, such disposition of parts is regarded as constituting *anteroposterior symmetry*, in which parts are supposed to be reversed repetitions of each other on opposite sides of an imaginary plane dividing the body transversely to its axis, in the same sense that right and left parts are reversed repetitions of each other in bilateral symmetry. The existence of the last is denied or ignored by those who consider the segments of an articulate or vertebrate body as simply serially homologous; but in the view of those who recognize it the back of the arm corresponds to the front of the thigh, the convexity of the elbow (backward) to the convexity of the knee (forward), the extensor brachii to the extensor cruris, etc. Anteroposterior symmetry is also recognized by some naturalists in certain arthropods from the arrangements of the legs (in amphipods, for example), the correspondences observed between anal and oral parts, etc. Since any body is a solid, and therefore may be intersected by three mutually perpendicular planes, two of which are concerned in bilateral and anteroposterior symmetry respectively, a kind of symmetry called *dorsobdominal symmetry* is recognized by some, being that of parts lying upon opposite sides of a longitudinal horizontal plane passing through the axis of the body, as that between the neural and hemal arches of a vertebra; but it is generally obscure, and probably never perfect. *Bilateral symmetry* (see *eudipleural*) is the nearly universal rule in vertebrates and articulates. The chief departures from it in vertebrates are in the family of flatfishes or flounders (as the plaice, turbot, halibut), in parts of the cranium of various cetaceans and the single great tusk of the narwhal, in the skulls (especially the ear-parts) of sundry owls, in the beak of a plover (*Anarhynchus*) which is bent sideways, in the atrophy of one of the ovaries and oviducts in most birds, and in the position finally assumed by the heart and great vessels and most of the digestive organs of vertebrates at large. (See cuts under *asymmetry*, *narwhal*, *plaice*, and *plover*.) In articulates notable exceptions to it are seen in the difference between the great claws or chela of a lobster, etc. In *Mollusca* asymmetry is the rule rather than the exception. (See *Antioptera*, *Isopleura*.) A certain asymmetry, apart from that exhibited by an animal body as a whole, may be also predicated of the several components of any part in their respective selves; as, the *symmetry* of a carpus or of a tarsus whose several bones are regularly disposed on each side of its axial plane, or around a central bone. (See cuts under *carpus* and *tarsus*.)

—*Axis of symmetry*. See *axis*.—*Center of symmetry*. See *center*.—*Kinetical symmetry*, the equality of the principal axes of a body through its center of mass.

—*Plane of symmetry*, a symmetrical or median plane.

—*Quartic symmetry*. See *quartic*.—*Quintic symmetry*,

regularity of form depending on a pentagon being regular. See *quintic*.—*Radial symmetry*. See def. 5 (b).—*Rectangular or right symmetry*, symmetry depending on that of the right angle, or consisting in some angle being a right angle.—*Skew symmetry*. See *skew*.—*Uniform symmetry*, in *arch.*, such disposition of parts that the same ordonnance reigns throughout the whole.—*Syn. Symmetry, Proportion*. *Proportion* is the more general word, being applicable to numbers, etc.; it is also the more abstract. *Symmetry* is limited to the relation of the parts of bodies, especially living bodies; as, *symmetry* in the legs of a horse; it is thus sometimes more external. *Symmetry* sometimes is more expressive of the pleasure of the beholder. "*Symmetry* is the opposition of equal quantities to each other. *Proportion* the connection of unequal quantities with each other. The property of a tree in sending out equal boughs on opposite sides is *symmetrical*. Its sending out shorter and smaller toward the top, *proportional*. In the human face its balance of opposite sides is *symmetry*, its division upwards, *proportion*." (Ruskin.)

*sympalmograph* (sim-pal'mō-gráf), *n.* [*Gr. σῖν*, together, + *παλμός*, vibration (< *πάλειν*, vibrate), + *γράφειν*, write.] A kind of apparatus used to exhibit Lissajous curves (see under *curve*) formed by the combination of two simple harmonic motions. A convenient form employs a double pendulum, the rate of oscillation of whose parts can be varied at will, while a suitable style traces out upon a lampblack surface the curves resulting from the combined motions.

*sympathetic* (sim-pa-thet'ik), *a.* and *n.* [*Cf. sympathetics* (in technical use); < *LGr. συμπάθεσις*, having sympathy, < *Gr. συμπάθεια*, sympathy; see *sympathy*.] I. *a.* 1. Pertaining to, expressive of, proceeding from, or exhibiting sympathy, in any sense; attended with sympathy.

Cold reserve had lost its power  
In sorrow's sympathetic hour.

Scott, *Rokeby*, v. 11.

The *sympathetic* or social feelings are not so strong between different communities as between individuals of the same community.

Cathoun, *Works*, I. 9.

It is a doctrine alike of the oldest and of the newest philosophy that man is one, and that you cannot injure any member without a *sympathetic* injury to all the members.

Emerson, *West Indian Emancipation*.

The sentiment of justice is nothing but a *sympathetic* affection of the instinct of personal rights—a sort of reflex function of it.

H. Spencer, *Social Statics*, p. 116.

2. Having sympathy or common feeling with another; susceptible of being affected by feelings like those of another, or of altruistic feelings which arise as a consequence of what another feels.

Prior, Epilogue to Mrs. Manby's *Lucius*.  
Wiser he, whose sympathetic mind  
Exults in all the good of all mankind.

Goldsmith, *Traveller*, l. 43.

3. Harmonious; concordant; congenial.

Now o'er the soothed accordant heart we feel  
A sympathetic twilight slowly steal.

Wordsworth, *An Evening Walk*.

My Imagination, which I suppose at bottom had very good reasons of its own and knew perfectly what it was about, refused to project into the dark old town and upon the yellow hills that *sympathetic* glow which forms half the substance of our genial impressions.

H. James, Jr., *Trans. Sketches*, p. 291.

4. In *anat.* and *zool.*, effecting a sympathy or consensaneous affection of the viscera and blood-vessels; uniting viscera and blood-vessels in a nervous action common to them all; inhibitory of or controlling the vital activities of viscera and blood-vessels, which are thereby subjected to a common nervous influence; specifically, of or pertaining to a special set of nerves or nervous system called the *sympathetic*. See below.—5. In *acoustics*, noting sounds induced not by a direct vibration-producing force, but by vibrations conveyed through the air or other medium from a body already in vibration. The phenomena of resonance are properly examples of sympathetic sound.—*Sympathetic headache*, pains in the head as the result of comparatively distant irritations.—*Sympathetic ink*. See *ink*.—*Sympathetic nerve*, a nerve of the sympathetic system; in particular, one of the two main ganglionic cords extending the whole length of the vertebral column. These ganglia, in man, correspond in number to the vertebrae against which they lie, except in the neck, where there are three pairs, and on the coccyx, where there is but a single one, the ganglion impar. Communicating branches, *rami communicantes*, *rami viscerales*, to and from the spinal and some of the cranial nerves, unite the sympathetic system with the cerebrospinal axis. The branches of distribution of the sympathetic system supply chiefly the trunk-viscera and the walls of the blood-vessels and lymphatics. The sympathetic nerves differ from the cerebrospinal nerves in having generally a grayish or reddish color, and in the greater number and more widely distributed ganglia connected with them. The sympathetic nerve is also called *great sympathetic*, *triple sympathetic*, *sympathetic*.—*Sympathetic nervous system*. (a) In vertebrates, a set of nerves consisting essentially of a longitudinal series of ganglia on each side of the spinal axis, connected by commissures or commissural nerve-fibers, forming a double chain from head to tail, and giving off numerous branches which form special plexuses

in the principal cavities of the body, and other plexuses surrounding and accompanying the viscera and blood-vessels, disinct from but intimately connected by anastomoses with the nerves of the cerebrospinal system. In man the sympathetic system consists (1) of the two main ganglionic chains above described; (2) of four pairs of cranial ganglia; (3) of three great ganglionic plexuses or sympathetic plexuses, in the thoracic, abdominal, and pelvic cavities respectively; (4) of smaller ganglia in connection with the abdominal and other viscera; (5) of communicating nerves or commissures, whereby these ganglia or plexuses are connected with one another and with nerves of the cerebrospinal system; (6) of distributory nerves supplying the viscera and vessels, whereby the sympathetic reaches all parts of the body. See *ganglion* and *plexus*. (b) In invertebrates, as *Vermetes*, a posterior part of the visceral nervous system, passing on to the enteric tube, and corresponding to a true enteric nervous system: so called in view of its physiological relations, without reference to the actual homology implied with the sympathetic system of a vertebrate.—*Sympathetic numbers*, numbers absurdly supposed to have a tendency to come together by chance.—*Sympathetic ophthalmia*, inflammation of one eye due to lesion in the opposite eye.—*Sympathetic powder*. See *powder*.—*Sympathetic resonance*, the communication of vibration from one sounding body to another in its proximity. Thus, if two musical strings are stretched over the same sounding-board and one of them is struck, the other will vibrate also if tuned to the same note, or, further, if tuned to give the octave or the fifth.—*Sympathetic sounds*, sounds produced by means of vibrations caused by the vibrations of some sounding body, these vibrations being communicated by means of the air or some intervening liquid or solid body.—*Sympathetic string*, in various classes of stringed musical instruments, a string that is intended to be sounded by sympathetic vibration, and not by direct excitation.

II. *n.* 1. The sympathetic nervous system, or the sympathetic nerve.—2. One who is peculiarly susceptible, as to hypnotic or mesmeric influences; a sensitive.

Favorable conditions may make any one hypnotic to some extent, in a degree sufficient, perhaps, to dull the physical vision and excite the mental vision. Naturally enough a company of *sympathetics* may be similarly influenced.

N. A. Rev., CXLVI. 705.

*sympathetical* (sim-pa-thet'ik-al), *a.* [*Cf. sympathetic + -al*.] Same as *sympathetic*.

(b) To feel in consequence of what another feels; be affected by feelings similar to those of another, commonly in consequence of knowing the other to be thus affected.

**sympathy** (sim'pā-thī), *n.*; pl. *sympathies* (-thīz). [Formerly also *sympathie*, *sympathic*; = F. *sympathie* = Sp. *simpatía* = Pg. *sympathia* = It. *simpatia*, < L. *sympathia*, < Gr. *συμπάθεια*, fellow-feeling, community of feeling, sympathy, < *συμπαθής*, having a fellow-feeling, affected by like feelings, sympathetic, also exciting sympathy, < *σύν*, with, + *πάθος*, feeling, passion; see *pathos*. Cf. *apathy*, *antipathy*.] 1. Feeling identical with or resembling that which another feels; the quality or state of being affected with feelings or emotions corresponding in kind if not in degree to those which another experiences: said of pleasure or pain, but especially of the latter; fellow-feeling; commiseration; compassion. In writers not quite modern an occult influence of one mind (or body) by another is meant, but this meaning is now almost forgotten.

In order to awaken something of *sympathy* for the unfortunate natives. *Burke*, Fox's East India Bill.

The word *sympathy* may also be used on this occasion, though the sense of it seems to be rather more extensive. In a good sense, it is styled benevolence; and, in certain cases, philanthropy; and, in a figurative way, brotherly love; in others, humanity; in others, charity; in others, pity and compassion; in others, mercy; in others, gratitude; in others, tenderness; in others, patriotism; in others, public spirit.

It is true that *sympathy* does not necessarily follow from the mere fact of gregariousness. Cattle do not help a wounded comrade; on the contrary, they are more likely to dispatch him.

*W. James*, Prin. of Psychology, II. 210.  
2. An agreement of affections or inclinations, or a conformity of natural disposition which makes two persons agreeable each to the other; mutual or reciprocal inclination or affection; sympathetic interest: in this sense commonly followed by *with*: as, to have *sympathy with* a person in his hopes, aspirations, or aims.

3. In *physiol.* and *pathol.*: (a) That state of an organ or a tissue which has a certain relation to the condition of another organ or tissue in health and disease; a related state of the vital manifestations or actions in different organs or tissues, such that when one part is excited or affected others are also affected; that relation of the organs and parts of a living body to each other whereby a disordered condition of one part induces more or less disorder in another part: as, for example, the pain in the brow caused by taking a draught of cold water into the stomach, the pain in the right shoulder arising from disease of the liver, or the irritation and vomiting produced by a tumor of the brain. (b) The influence which the physiological or pathological state of one individual has in producing the same or an analogous state in another at the same time or in rapid succession, as exemplified in the hysterical convulsions which affect a number of women on seeing one of their companions suffering from hysteria, or the yawning produced by seeing an

other yawn.—4t. Physical action at a distance (so used by old writers against astrology, who argue that the influence of the stars is not physical sympathy and not moral sympathy, and therefore does not exist at all): as, the *sympathy* between the lodestone and iron.

What we call *sympathies* and antipathies depending indeed on the peculiar textures and other modifications of the bodies between whom these friendships and hostilities are said to be exercised, I see not why it should be impossible that there be a cognation betwixt a body of a congruous or convenient texture and the effluvia of any other body. *Boyle*, Hidden Qualities of Air.

5. In *acoustics*, the fact, condition, or result of such a relation between two vibratile bodies that when one is thrown into vibration the other tends to vibrate in a similar or related way, in consequence of the vibrations communicated to it through the air or some other medium.—**Powder of sympathy**. A consonance or harmony of sounds agreeable to the ear, whether the sounds are vocal or instrumental, or both.

The Poetes cheife Musicke lying in his rime or conorde to heare the *Symphonie*, he maketh all the hast he can be at the end of his verse, and delights not in many staves by the way, and therefore giueth but one Censure to any verse. *Puttenham*, Arte of Eng. Poesie, p. 62.

Sound and sweetness, voice, and *symphonie*, Concord, Consent, and heav'nly harmonie. *Heywood*, Hierarchy of Angels, p. 582.

2. In *music*: (a) Same as *symphonial*, 2.

Dwelling in this place. *Chaucer*, Sir Thopas, l. 104.

(b) Same as *ritornelle*. (c) An elaborate composition in three or more movements, essentially similar in construction to a sonata, but written for an orchestra, and usually of far grander proportions and more varied elements.

The symphony is now recognized as the highest kind of instrumental music. It was brought to its classical form mainly by Haydn in the last part of the eighteenth century, and has since been extensively developed by Mozart, Beethoven, Mendelssohn, Schumann, Brahms, and others.

**Symphoricarpos** (sim-fō'ri-kār'pos), *n.* [NL. (Dillenius, 1732), so called in allusion to the clustered berries; < Gr. *συμφορεῖν*, bear together (< *σύν*, together, + *φορέω* = E. *bear*), + *καρπός*, fruit.] A genus of gamopetalous shrubs, of the order *Caprifoliaceae* and tribe *Lonicereae*. It is characterized by flowers with a cup-shaped and four- or five-toothed calyx, a funnel- or bell-shaped corolla bearing as many lobes and epipetalous stamens, and an ovary of four cells, two with a few imperfect ovules, the others each with the ovule solitary, perfect, and pendulous. The 8 or 9 species are natives of the United States, Canada, and the mountains of Mexico. They are mainly western; one, *S. occidentalis*, extends north to latitude 64°. They are smooth or hairy shrubs with slender four-angled branchlets and scaly buds, producing opposite ovate leaves which are entire or

obtusely toothed on young plants. The small white or red flowers are arranged in short axillary spikes or in racemes, and are followed by fleshy white or red berries, each with four cells but only two seeds. In several species the corolla is remarkably filled with close white hairs. For the three eastern species, see *coral-berry*, *snowberry*, and *scoffberry*; the first is also known as *Indian currant*, and a general name is *St. Peter's-wort*.

**symphoricarpous** (sim'fō-ri-kār'pus), *a.* [*Gr.* *συμφορεῖν*, bear together, + *καρπός*, fruit.] In *bot.*, bearing several fruits clustered together.

**symphyanthorous** (sim-fi-an'thēr-us), *a.* [*Gr.* *συμφύειν*, growing together (*συμ*, together, + *φύειν*, grow), + *NL.* *anthera*, anther, + *-ous*.] In *bot.*, same as *synantherous*.

**symphycaous** (sim-fi-kār'pus), *a.* [*Gr.* *συμφύειν*, growing together, + *καρπός*, fruit.] In *bot.*, having the fruit confluent, as the disks of the apothecia in certain gymnocarpous lichens.

**Symphyla** (sim-fi-lī), *n. pl.* [*NL.*, *Gr.* *σύνφυλος*, of the same stock, *συμ*, together, + *φύλον*, race, a tribe: see *phylum*.] An order or suborder of insects, combining some characters which are now mostly manifested in widely distinct types. This group is represented by the *Scolopendrellidae*, and forms in some respects a connecting-link between the classes of myriapods and hexapods. All the known species are small (less than 7 millimeters in length); they resemble minute centipeds, and each abdominal segment bears a pair of legs; with the exception of these appendages, however, the structure resembles that of some thysanurous insects. The legs are five-jointed, and end in a pair of claws.

The reasonableness of placing the *Symphyla* (= *Scolopendrella*) of Ryder in the Thysanura, with the Collembola and Cinnara as coordinate groups.

*S. H. Scudder*, Mem. Acad. Nat. Sci., III. 90.

**symphyllous** (sim-fil'us), *a.* [*Gr.* *συμφύειν*, together, + *φύλλον*, a leaf, + *-ous*.] In *bot.*, same as *gamophyllous*.

**symphyllous** (sim-fi-lus), *a.* [*Gr.* *σύνφυλος*, + *-ous*.] Having characteristics of the *Symphyla*; combining characters of myriapods with those of the true hexapods, or six-footed insects.

**symphyote** (sim-fi-nōt), *a.* [*Gr.* *σύνφύειν*, growing together, + *ῥίζα*, the back.] Soldered together at the back or hinge, as the valves of some unios, or having valves so soldered, as a unio: the opposite of *asymphyote*.

In some of the species the valves become soldered together at the hinge, so that motion would be impossible were it not for the fact that a fracture takes place near the line of junction, so that one valve bears two wings and the other none. This fact has been used by Dr. Lea to divide the numerous species of Unio into two groups, those with soldered hinge being called *symphyote*, and those with the normal structure *asymphyote* forms.

*Stand. Nat. Hist.*, I. 270.

**symphyogenesis** (sim-fi-ō-gen'e-sis), *n.* [*Gr.* *σύνφύειν*, grow together, + *γένεσις*, generation: see *genesis*.] In *bot.*, the forming by union of previously separate elements.

**symphyogenetic** (sim-fi-ō-jē-net'ik), *a.* [*Gr.* *σύνφύειν*, grow together, + *γενετικός*, pertaining to generation, after *genetic*.] In *bot.*, formed by the union of previously separate elements.

**symphyostemonous** (sim-fi-ō-stem'ō-nus), *a.* [*Gr.* *σύνφύειν*, grow together, + *στῆμον*, the warp in a loom (in mod. bot. a stamen).] In *bot.*, having the stamens united; monadelphous.

**symphysal** (sim-fi-zāl), *a.* Same as *symphysical*.

**symphyseal** (sim-fiz'e-āl), *a.* [*Gr.* *σύνφύειν*, grow together, + *σύνφύσις*, union, + *-eal*.] Of or pertaining to a symphysis; entering into the formation of a symphysis: as, *symphyseal* union or connection; a *symphyseal* line or surface; the *symphyseal* ends of bones; a *symphyseal* ligament.—**Symphyseal angle**, in *eraniom.*, the angle between the line in the median plane of the skull tangent to the mental prominence and to the alveolar border of the lower jaw and the plane tangent to the anterior part of the lower border of the lower jaw. See cut under *eraniometry*.

**symphyseotome** (sim-fiz'ē-ō-tōm), *n.* [*Gr.* *σύνφύειν*, symphysis, + *-τομή*, *Gr.* *τέμνειν*, *ταμίν*, cut.] In *surg.*, a knife used in section of the symphysis pubis.

**symphyseotomy** (sim-fiz'ē-ōt'ō-mī), *n.* [*Gr.* *σύνφύειν*, symphysis, + *-τομία*, *Gr.* *τέμνειν*, *ταμίν*, cut.] In *surg.*, the operation of dividing the symphysis pubis for the purpose of facilitating labor; the Sigaultian section or operation.

**symphysial**, **symphysian** (sim-fiz'i-āl, -ān), *a.* Same as *symphysical*.

**symphysis** (sim-fi-sis), *n.*; *pl.* *symphyses* (-sēz). [= *F.* *symphyse*, *NL.* *symphysis*, *Gr.* *σύνφύειν*, a growing together, union, *συμφύειν*, cause to grow together, mid. *συμφύειν*, grow together, *συμ*, together, + *φύειν*, produce, grow.] 1. In *anat.* and *zool.*: (a) The union or connection of bones in the middle line of the body, either by confluence, by direct apposition, or by the intervention of cartilage or ligament; also, the

part, or configuration of parts, resulting from such union or connection. Symphysis usually constitutes an immovable joint, and may be so intimate that all trace of original separateness of the parts is lost. These two conditions are illustrated in the human body in the symphysis of the pubic bones and of the two halves of the lower jaw respectively; but in many animals symphyses remain freely movable, as in the two halves of the lower jaw of serpents. The term is chiefly restricted to the growing together or close apposition of two halves of a bilaterally symmetrical bone, or of a bone with its fellow of the opposite side—other terms, as *ankylosis*, *synostosis*, *synchondrosis*, and *suture*, being applied in other cases. See cuts under *innominatum* and *pelvis*. (b) Some point or line of union between two parts; a commissure; a chiasm: as, the *symphysis* of the optic nerves. (c) Attachment of one part to another; a growing together; insertion or gomphosis with union: as, the *symphysis* of teeth with the jaw. See *acrodont*, *pleurodont*. (d) Coalescence or growing together of parts so as to close a natural passage: atresia.—2. In *bot.*, a coalescence or growing together of similar parts.—**Ilac**, **ischiatric**, **pubic symphysis**. See the adjectives.—**Mental symphysis**, **symphysis mandibularis**, **symphysis menti**, the union or apposition of the two halves of the lower jaw-bone; the midline of the chin in man, the gonys or gonial line of a bird, etc.—**Symphysis pubis**, the pubic symphysis.

**symphytism** (sim-fi-tizm), *n.* [*Gr.* *σύνφύειν*, growing together, *συμφύειν*, grow together: see *symphysis*.] In *gram.*, a coalescence of the elements of words. *Earle*.

**Symphytum** (sim-fi-tum), *n.* [*NL.* (Tournefort, 1700), *Gr.* *σύνφύειν*, plant, comfrey, boneset (so named from its reputed medicinal power), *συμφύειν*, make to grow together: see *symphysis*.] A genus of gamopetalous plants, of the order *Boraginaceae*, tribe *Boragaceae*, and subtribe *Anchuseae*. It is characterized by a broadly tubular corolla with short somewhat erect lobes, bearing within five scales and five short stamens with linear anthers. About 17 species are known, natives of Europe, northern Africa, and western Asia, and occasionally naturalized elsewhere, as *S. officinale* in the eastern United States. They are commonly rough erect herbs, sometimes with a tuberous root. They bear alternate or mostly radical leaves the uppermost sometimes nearly opposite. The flowers are blue, purplish, or yellowish, and form parted terminal cymes or simple one-sided racemes. The species, especially *S. officinale* (see cut under *scorpioid*), are known as *comfrey*. *S. tuberosum* with pale-yellow and *S. asperatum* with light-blue flowers are occasionally cultivated for ornament. The latter, the prickly comfrey, is also a forage-plant, said to support large flocks and herds in the Caucasus, its native region. It has excited much interest and to some extent been introduced elsewhere, especially in Australia. It is a hardy plant, yielding heavily, and is relished by cattle after they have become accustomed to it, though commonly refused by them at first.

**sympiesometer** (sim'pi-e-som'e-tēr), *n.* [*Irreg.* *Gr.* *σύνπιεσις*, a pressing together (*σύνπιεῖν*, press or squeeze together, *σύν*, together, + *πιεῖν*, press, squeeze), + *μέτρον*, measure.] 1.

Sympiesometer, 1.

2. A form of barometer in which the pressure of the atmosphere is balanced partly by the weight of a column of liquid and partly by the elastic pressure of a confined mass of gas. As originally constructed by Adie of Edinburgh, it consists of a short inverted siphon-tube, with a bulb blown on the end of the longer leg, while the shorter leg is left open. The bulb and the upper end of the tube are filled with air or hydrogen, and the lower part of the tube with glycerin. The pressure of the atmosphere exerted upon the surface of the liquid is balanced by the pressure of the enclosed gas and by the weight of the column of liquid which is supported. The level of the liquid constitutes the reading of the instrument. At each observation the scale is adjusted for the temperature, and an attached thermometer forms an essential auxiliary. The sympiesometer is more sensitive than the mercurial barometer, but it does not so well maintain its constancy, and its readings cannot be so accurately corrected and evaluated. An improved form of the instrument consists essentially of a piston-barometer, with air above the column of liquid instead of a vacuum. The measurement consists in determining the height of a column of liquid required to keep the enclosed air compressed into a standard volume. By this method of use the theory of the instrument is

simplified, and the readings are easily evaluated. Also *sympiesometer*.

**symplectic** (sim-plek'tik), *a.* and *n.* [*Gr.* *συμπλεκτικός*, twining together, *συμπλέκειν*, twine or weave together, *σύν*, together, + *πλέκειν*, twine, weave: see *plicate*.] 1. *a.* Placed in or among, or put between, as if ingrained or woven in: specifically noting a bone of the lower jaw of fishes interposed between others.

II. *n.* A bone of the lower jaw or mandibular arch of some vertebrates, as fishes, between the hyomandibular bone above and the quadrate bone below, forming an inferior ossification of the suspensorium of the lower jaw, articulated or ankylosed with the quadrate or its representative. Also called *mesotympanic*. See cuts under *palatoquadrate* and *teleost*.

**symplesite** (sim'ple-sit), *n.* [So called in allusion to its relation to the other minerals named; *Gr.* *σύν*, together, + *πλησιάζειν*, bring near, mid. come near (*πλησιος*, near), + *-ite*.] A mineral occurring in monoclinic crystals and crystalline aggregates. It is an arseniate of ferrous iron, belonging in the group with vivianite and erythrite.

**Symplocarpea** (sim-plō-kār'pē-ē), *n. pl.* [*NL.* (A. Engler, 1879), *Gr.* *συμπλοκαρπία*, A subtribe of plants, of the order *Araceae* and tribe *Monsteroideae*. It is marked by a subterranean rootstock, by leaves distichous when young, spiral when mature, by bisexual flowers, and seeds with a large embryo without albumen. It consists of three singular monotypic and mostly American genera, of which the largest, *Lysichiton*, occurring in California, Alaska, Siberia, and Japan, produces elliptical leaves reaching 3 feet in length; for the others, see *Orontium* and *Symplocarpus*.

**Symplocarpus** (sim-plō-kār'pus), *n.* [*NL.* (Salisbury, 1818), so called with ref. to the union of the ovaries into a multiple fruit; short for *\*symplococarpus*, *Gr.* *σύνπλοκος*, interwoven (see *symploce*), + *καρπός*, fruit.] A genus of plants, of the order *Araceae*, type of the subtribe *Symplocarpeae*; the skunk-cabbage. It is characterized by a globose, arching, and hooded persistent spathe containing fertile bisexual flowers crowded on a nearly globose spadix, each with four perianth segments, four stamens, and a thick four-angled style crowning an ovary with a single cell and ovule or with a second empty cell. The only species, *S. foetidus*, is a native of America, northeastern Asia, and Japan, common in bogs and moist places in the eastern or central United States from Iowa to North Carolina and in Nova Scotia. It is a robust herb with a thick descending rootstock, producing a crown of large ovate and heart-shaped coriaceous leaves. The streaked or mottled spathe rises a few inches above the ground, and incloses a comparatively small brownish spongy spadix, which ripens into a globose syncarp of berries, each with a single large rounded seed filled with a solid fleshy embryo. From the very large broad leaves, and from its odor when bruised, the plant is known as *skunk-cabbage* (which see, under *cabbage*). See also *dracontium*, 2.

1. Flowering Plant of Skunk-cabbage (*Symplocarpus foetidus*); 2, the spathe laid open, showing the spadix after flowering; 3, the leaf.

**symploce** (sim'plō-sē), *n.* [*Gr.* *σύνπλοκή*, an interweaving, interlacing (cf. *σύνπλοκος*, interwoven), *Gr.* *σύνπλέκειν*, weave together: see *symplectic*.] In *rhet.*, the repetition of one word at the beginning and another at the end of successive clauses, as in the sentence "*Mercy* descended from heaven to dwell on the earth; *Mercy* fled back to heaven and left the earth." This figure is a combination of epianaphora and epistrophe (whence the name). Also, incorrectly, *simploce*.

Take me the two former figures (anaphora and antistrophe) and put them into one, and it is that which the Greeks call *symploche*, . . . and is a manner of repetition. *Pultenham*, *Arte of Eng. Poessie*, p. 168.

**symplocium** (sim-plō'si-um), *n.* [*NL.*: see *symploce*.] In *bot.*, the annulus in the sporangium of ferns.

**Symplocos** (sim'plō-kos), *n.* [*NL.* (J. F. Jacquin, 1763), named from the stamens, which are highly monadelphous in some species; *Gr.* *σύνπλοκος*, interwoven: see *symploce*.] A genus of gamopetalous plants, of the order *Styracaceae*. It is characterized by flowers having numerous stamens with short anthers and in many rows, and a two- to five-celled ovary containing two or rarely four pendulous ovules in each cell, and ripening into a fleshy indehiscent fruit crowned with the calyx-lobes, and filled by a single oblong seed having a terete embryo, long radicle, and short cotyledons. There are about 165 species, natives of warmer parts of Asia, Australia, and America, but not known in Africa. They are trees or shrubs, often smooth, and turning yellowish in drying. They bear alternate toothed or entire leaves, and axillary racemes or spikes, sometimes reduced to a single flower. The fruit is an oblong or roundish berry or drupe. Several species, with yellow, red, or white flowers, are occasionally cultivated.

For *S. tinctoria*, the only species in the United States, see *sweetleaf*. The bark and leaves of this and several other species, particularly of *S. racemosa*, the lodh-bark tree of India, are used as a dye. The leaves of *S. ramossissima* of the Himalayas are said to be there the food of the yellow silkworm. All contain an astringent principle in their leaves. The leaves of *S. Alstonia* (*Alstonia theaeformis*), a branching South American shrub, are used as a substitute for tea in Brazil.

**sympode** (sim'pōd), *n.* [*sympodium*, *q. v.*] Same as *sympodium*.

**sympodium** (sim-pō'di-um), *n.*; pl. *sympodia* (-i).

[NL., < Gr. *σύν*, with, + *πόδιον* (πόδ-) = *E. foot*.] In *bot.*, an axis or stem which imitates a simple stem, but is made up of the bases of a number of axes which arise successively as branches one from another. The grape-vine furnishes a perfect example. Compare *monopodium* and *dichotomy*. Also called *pseudo-axis*.

Thus in a dichotomous branching only one of the secondary axes may develop strongly, the weaker branch appearing as a small lateral shoot from its base; and an apparent primary shoot is thus produced which in reality consists of the bases of single branches of consecutive forkings. Such an axis is termed a *pseudaxis* or *sympodium*. *Encyc. Brit.*, IV, 93.

**sympolar** (sim-pō'lār), *a.* [*Gr. σύν*, with, + *E. polar*.] Polar to one another.—**Sympolar pair** of heteropolars, a pair of polyhedra such that to each face of the one corresponds a summit of the other, and vice versa.

He does not condemn sometimes a little larger and more pleasant carouse at set banquets, under the government and direction of some certain prudent and sober *symposiarchs* or masters of the feasts. *Tom Brown*, *Works*, III, 260. (*Davies*.)

The symposium usually followed a dinner, for the Greeks did not drink at meals. Its enjoyment was heightened by intellectual or agreeable conversation, by the introduction of music or dances, and by other amusements. The beverage was usually wine diluted with water, seldom pure wine.

In these *symposia* the pleasures of the table were improved by lively and liberal conversation. *Gibbon*, *Misc. Works*, I, 115.

The reader's humble servant was older than most of the party assembled at this *symposium* [Philip's call-supper]. *Thackeray*, *Philip*, vii.

They are divided into subjective symptoms, or abnormal feelings on the part of the patient, and objective symptoms, which are evident to the senses of the observer. ## synagogue

The term *synagogue* (like our word church) signifies first the congregation, then also the building where the congregation meet for public worship.

Schaff, Hist. Christ. Church, I. § 51.

2. The building where such instruction and worship are maintained. The synagogue first came into prominence in the religious life of the Jewish people during the exile, and, since the destruction of the temple and the dispersion of the Jews, constitutes their customary place of worship. The organization of the synagogue consists of a board of elders presided over by a ruler of the synagogue (Luke viii. 41, 49, xiii. 14). The worship is conducted according to a prescribed ritual, in which the reading of the Scripture constitutes a prominent part. Formerly the officers of the synagogue exercised certain judicial functions, and the synagogue itself was the place of trial (Luke xii. 11, xxi. 12), but this is no longer the case.

There beside was the *Synagogue*, where the Bysshoppes of Jewes and the Pharyses camen to gidere, and hielden here Conselle. Mandeville, Travels, p. 93.

3. An assembly of Jewish Christians in the early church.

If there come into your *synagogue* a man with a gold ring, in fine clothing, . . . and ye have regard to him that weareth the fine clothing, . . . are ye not . . . become judges with evil thoughts? Jas. ii. 2 (R. V.).

Hence—4. Any assembly of men. [Rare.]

**synalephe**, **synalophe** (sin-a-lē'fē), *n.* [= *F. synalephe*, *< L. synalophe*, *< Gr. συναλοιφή*, the contraction of two syllables into one, *< συναλειφειν*, smear together, smooth over, unite, *< συν*, together, + *αλειφειν*, anoint.] The blending of two successive vowels so as to unite them in one syllable, as by syneresis, synizesis, crasis, so-called elision, or a combination of these; especially, the obscuration or suppression of a final vowel-sound (vowel or diphthong) before an initial vowel-sound, as in *th' enemy* for *the enemy*. Usually, as in the instance just given, the final vowel is only obscured, not suppressed, being audible. When the final vowel is entirely suppressed, as in French *l'amī* for *le ami*, there is no longer a true blending or synalephe, but the term has been extended to include such cases. What is commonly called *elision* is usually synalephe or blending, not ecclipsis or suppression.

I have named the *synalepha*, which is the cutting off one vowel immediately before another.

The tail is fitted for climbing and scrambling about in trees and bushes, as in the creepers, and the feet are strongly prehensile, with large curved claws. They are small birds (a few inches long), but build huge coarse nests, sometimes 2 or 3 feet in diameter, or as large as a barrel, of sticks and twigs loosely thrown together, in the recesses of which the eggs are laid upon a nest proper of soft substances. There is great uniformity in the eggs, which are of a white or pale-bluish color. The subfamily is also called *Anabatinae*.

These animals resemble worms, and are of such delicacy of structure as to be almost transparent. The long thin cylindrical body is constricted here and there, and the head is surrounded with a fringe of tentacles. The calcareous concretions of the integument which form a hard shell or test in most echinoderms are here reduced to certain flat perforated plates here and there, to which anchorate hooks or anchor-shaped spicules are attached, forming very characteristic structures. (See cuts at *ancora*, *Holothuriidæ*, and *Synaptidæ*.) There are several species. *S. digitata* is British. *S. girardi* is common on the Atlantic coast of the United States, living in the sand at about low-water mark. They are fragile marine organisms, vermiform, and so transparent or with such thin and colorless skin that the internal organs may be seen through it.

Baird, 1857), < Gr. *σύν*, joined together, + *μῦς*, a mouse.] A remarkable genus of *Arvicolinæ*, connecting the lemmings with ordinary voles or field-mice (whence the name). The upper incisors are grooved, a feature unique in the subfamily; the teeth in other respects, and the skull, are as in the true lemmings of the genus *Myodes*, while the external characters are those of *Arvicola* proper. There is only

The word has somewhat varied application to certain embryonic formations and to some adult tissues, as striped muscular fiber, certain parts of sponges, etc.

The ectoderm [of a calcareous sponge] is a transparent, slightly granular, gelatinous mass in which the nuclei are scattered, but which, in the unaltered state, shows no trace of the primitive distinctness of the cells which contain these nuclei, and is therefore termed by Haeckel a *syncytium*. *Huxley, Anat. **syngensis** (sin-je-nē'sis), *n.* [NL., < Gr. *σιν*, together, + *γενεσις*, generation.]

Reproduction in which a male and a female take part, one furnishing spermatozoa and the other an ovum, so that the substance of the embryo is actually derived from both parents. This is the rule, perhaps without exception, in sexual generation, and opposes the view of the spermists, that the embryo comes from the male element, for the development of which the female furnishes only the nidus, and that of the oovists, that the embryo is derived entirely from the female, the male principle affording only the requisite stimulus to development. As a doctrine or theory, one form of syngensis supposes every germ to contain the germs of all generations to come, and is opposed to *epigenesis*.

The theory of *syngensis*, which considers the embryo to be the product of both male and female, is as old as Empedocles. G. H. Leiser, Aristotle, p. 363.

Growth, therefore, was, on this hypothesis (of Buffon's), a process partly of simple evolution, and partly of what has been termed *syngensis*. Huxley, *Evol. in Biol.*

It is characterized by a climbing shrubby stem, stamens connate into a prismatic body, and coherent ovaries with anatropous basilar ovules solitary in their one or two cells. The fruit is a mucilaginous syncarp, composed of coalescent berries with black obovoid seeds without albumen, and mainly composed of the large embryo. There are about 10 species, natives of tropical America, from the West Indies and Mexico to Brazil. They are irregular climbers, rooting at the nodes, and there bearing long-stalked leaves, the earlier arrow-shaped, the later three- to nine-divided. The flowers are produced on a monoclous spadix, the staminate part club-shaped and much longer, borne in a still longer spathe, which consists of an ovoid persistent tube and a shell-shaped, finally reflexed, and deciduous upper section. *S. auratum*, long cultivated under the name *Caladium*, is known in Jamaica as *feefinger*, from its five-parted leaves.

Cf. *exode*, *exodus*.] 1. An assembly of ecclesiastics or other church delegates duly convoked, pursuant to the law of the church, for the discussion and decision of ecclesiastical affairs; an ecclesiastical council. Synods or councils are of five kinds—ecumenical, general, national, provincial, and diocesan. For definition of their several characteristics, see *council*, 7.

Why should you have a *Synod*, when you have a Convocation already, which is a *Synod*? Selten, *Table-Talk*, p. 108. Twice a year, in accordance with the canonical institutions of Christian antiquity, had it been ordered of old in an English Council that every bishop and his priests should meet together in *synod*; the common form of proceeding which was used in these early clerical gemotes is believed to be still extant. R. W. Dixon, *Hist. Church of Eng.*, xix. They [the bishops] had large estates which they held of the king, seats in the national council, preeminence in the national *synod*, and places in the general councils of the church. Stubbs, *Const. Hist.*, § 378.

Specifically—2. In Presbyterian churches, the court which ranks above the presbytery, and either is subordinate to a general assembly (as in most of the larger denominations) or is itself the supreme court of the church. In the former case the presbyteries of the whole church are grouped into synods, each of which comprises all the parishes or congregations of a particular district. The members of the synod are in most cases the members of all the presbyteries within its bounds; but in some churches the court is composed of delegates from the presbyteries.

3. A meeting, convention, or council. Had a parliament Of fiefs and furies in a *synod* sat, And devis'd, plotted, parlied, and contriv'd, They scarce could second this. Heywood, *Fair Maid of the West* (Works, ed. 1874, II. 350). Well have ye judged, well ended long debate, *Synod* of gods! Milton, *P. L.*, ii. 391.

4. In *astron.*, a conjunction of two or more planets or stars. To the blanc moon Her office they prescribed; to the other five Their planetary motions and aspects, In sextile, square, or trine, and opposite, Of noxious efficacy, and when to join In *synod* unbeneign. Milton, *P. L.*, x. 661.

**Holy Governing Synod** (of all the Russians), a synod which is the highest ecclesiastical authority in the Russian Church. It consists of several metropolitans and other prelates and officials—the chief procurator of the synod representing the czar. It was instituted by Peter the Great in 1721, to supply the place of the patriarch of Moscow. The last patriarch had died about 1700, and Peter would not allow the appointment of a successor,

thinking the power of the patriarchal office too great. The orthodox national church of the kingdom of Greece is also governed by a synod of archbishops and bishops, independent of any patriarch.—**Mixed synod**, a synod composed of clergy and laity.—**Robber synod**. Same as *Latrocinium*, 2.

**Synodal** (sin'od-əl), *a.* and *n.* [*< L. synodalis, < synodus, synod: see synod.*] **I. a.** Pertaining to or proceeding from a synod; synodical.

**Synodical** (si-nod'i-kəl), *a.* [*< synodic + -al.*] 1. Pertaining to or transacted in a synod: as, *synodical proceedings* or forms.

As there were no other synods in the days of Uniformity than the convocations of the clergy, it has been necessary to resort to them wherever it has been desirable to dignify any measure of the Reformation by alleging for it *synodical* authority.

*R. W. Dixon, Hist. Church of Eng., xxi.*

2. In *astron.*, pertaining to a conjunction or two successive conjunctions of the heavenly bodies.—**Synodical month**. *Jer. Taylor, Works* (ed. 1835), II. 341.

2. In a synod; so as to form a synod.

*Waterland, Works, II. viii.*

**Synonym** (sin'ō-nim), *n.* [Also *synonyme* (formerly also, as *L.*, in plural *synonyma*, sometimes used as an *E.* singular); *< F. synonyme = Sp. sinónimo = Pg. synonymo = It. sinonimo, < L. synonymum, < Gr. συνώνυμος, a word having the same meaning with another, neut. of συνώνυμος, having the same name or meaning, < σύν, together, + όνομα, name: see onym.* Cf. *onym, antonym, homonym*, etc.] 1. A word having the same signification as another; one of two or more words which have the same meaning; by extension, a word having nearly the same meaning as another; one of two or more words which in use cover to a considerable extent the same ground: the opposite of *antonym*.

*Macaulay, Milton.*

*Synonyms* are words of like significance in the main, but with a certain unlikeness as well.

*Trench, Study of Words, p. 173.*

2. A word of one language which corresponds in meaning with a word in another language. See *heteronym*, 2, *paronym*, 2, and the quotation from Camden under *synonymize*.—3. In *nat. hist.*, a systematic name having the same, or approximately the same, meaning or application as another which has superseded it; a technical name which, by the rules of nomenclature, is not tenable. The question of the acceptance of a generic or a specific name depends upon the law of priority. (a) Botanists take 1753, the year of the publication of Linnaeus's "Species Plantarum," as the starting-point for both genera and species, since in this publication binomials were for the first time systematically adopted. The naming of a botanical species consists in conferring upon it two appellations, a generic and a specific; and adequate publication consists in issuing a printed diagnosis sufficient to identify the plant with certainty. The earliest name conferred after the above date is the name by which, according to the law of priority, the plant must be known, providing, of course, that the classification is correct; and it is held that a strict adherence to this rule is essential in order to a stable systematic nomenclature. Since plants have often been placed in a wrong genus, the question arises whether the absolutely first specific name is to be retained, or the first that was used with the right genus name; the former is the accepted alternative. The names thus discarded are called *synonyms*, though in a broader sense all the names from which the selection is made are synonyms. On account of unsettled usage synonyms must often be quoted. In obedience to the law of priority, Nuttall's name *Carya*, by which the hickory has been known since 1818, becomes a synonym of *Hicoria*, the earlier name of Rafinesque;

*Nymphæa* gives way to *Castalia*; *Adlumia cirrhosa* of Rafinesque to *Adlumia fungosa* of Aiton; *Trollius Americana* of Muhlenberg to *T. laxus* of Salisbury; etc. (b) Zoologists usually adopt a different date as the starting-point. In England and on the continent of Europe this is generally 1764, the date of the twelfth edition of the "Systema Nature" (with an express exception in favor of the genera (not the species) of Brisson, 1760); American zoologists nearly all start from 1758, the date of the tenth edition of the work named. This difference of dates is the chief incompatibility of two schools which have become known as the *English* and the *American*, neither of which has thus far yielded the point to the other. The former school contends that 1766 (the date of the last edition of the "Systema," revised by the author himself) represents the completion of the Linnean binomial system in zoology, the earlier editions having been but provisional or tentative; the latter school maintains that 1758 is the date when that system was first formally and consistently applied to zoology. In practice the whole matter of synonymy is extremely complicated by various considerations other than the single question of priority in any given case—as, for example, the adequacy or exclusiveness of the diagnosis upon which a name rests, recognizability of a description; acceptance of a name in a wide or a narrow sense by different authors; transference or cross-use of a name by different authors; erroneous identification and consequent wrong applications of a name; rejection of a name for one of several different reasons and introduction of another name in its stead; the question whether use of a name in botany precludes its subsequent use in zoology (and conversely); the question whether the same name can be an onym in more than one of the numerically enormous orders of insects; and, particularly, the biological question (a matter necessarily of expert opinion) of what constitutes a genus, species, subspecies, etc. To all the above considerations (besides which various others could be added) is to be added especially, in accounting for the vast number of synonyms which encumber zoological nomenclature, the incessant redescription and renaming of species and genera in ignorance of the fact (or ignoring the fact) that they had been named before, or mistaking them for valid when they are not. One singular class of malformed words, which, when properly respelled, are seen to be literally identical with other names from which they had appeared different by the misspelling; and with this class of synonyms is related another, arising from a mere difference in termination (as of gender, for example, *Picus* and *Pica*), infection, etc. (as *Synodus*, *Synodon*, *Synodontus*, *Synodontis*). Literal quibbles of this sort have proved so frequently vexatious that the American school has declared that a word must subsist precisely as originally printed, no matter how malformed or misspelled, unless a typographical error be manifest, and that any two words which are differently spelled are tenable as different names, if the distinction be anything more or other than mere change of termination (as *-us*, *-a*, *-um*, or *-ites* and *-itis*, as distinguishing grammatical gender). Irrespective of the law of priority, and also of any such moot points as are above cited, the rules of nomenclature require (1) that no specific or subspecific name shall be used twice in the same genus; and (2) that no generic name, or name of any higher group, shall be used twice in the animal kingdom. There is thus, theoretically, but a single onym (tenable binomial designation) of every species, and a single onym of every genus or higher group—all other designations being in every case synonyms. Practically, however, the case is far from any such simplicity and uniformity; alternative technical names incessantly recur in the literature of zoology; and the synonymy of numberless species, genera, etc., is in almost inextricable confusion. The number of synonyms in zoology vastly exceeds that of theonyms; most species which have long been known have acquired a larger number of New Latin synonyms than of English names; very many have been placed in a dozen or more different genera, and have been described under as many different specific names—the various combinations of which generic and specific designations are a third source of uncounted synonyms. Such uncertainty and inconvenience have resulted from all these nomenclatural vagaries that some zoologists do not hesitate to ignore the fundamental law of priority, and continue to call a species by the technical name by which it has been oftenest called already. Such consensus of the nomenclators has at least the advantage of presenting better-known instead of less-known names.

*Selden*, *Illustrations of Drayton's Polyolbion*, ii.

4. A system of synonyms; a collection of synonyms; also, the study of synonyms; the use of synonyms in expressing different shades of meaning; the discrimination of synonyms; especially, in *nat. hist.*, the sifting of synonyms to determine the onyms. In botany and zoology the synonymy of a species of plant or animal, in the concrete, is a list of the several different names which have been applied to it by its various describers or classifiers, implying on the synonymist's part the discrimination not only of the synonyms of the species, but of the homonyms of related species, for the especial purpose of determining the onym of each species. Thus, *Falco fuscus* and *Falco obscurus* may be synonyms of one and the same species of falcon, yet *Falco fuscus* may be a homonym of two different species of falcon, and it may be that neither name is the onym of either of these species. Synonymy in natural history has become of late years so extensive and so intricate that probably no naturalist has mastered the subject beyond the line of some one narrow specialty. Synonymic lists for single species extending over several pages of an ordinary book are of no infrequent occurrence. See *synonymy*, 3.

The inconveniences arising from the want of a good nomenclature were long felt in Botany, and are still felt in Mineralogy. The attempts to remedy them by *Synonymies* are very ineffective, for such comparisons of synonyms do not supply a systematic nomenclature.

See *gospel*, 2.

II. *n.* One of the synoptic gospels; also, one of the writers of the synoptic gospels; a synoptist.

Yet the Tübingen professors and our Liberal newspapers must surely have something to go upon when they declare that the Jesus of the Fourth Gospel speaks quite differently from the Jesus of the *Synoptics*, and propound their theory of the Gnostic philosopher inventing, with profoundly calculated art, his fancy Gospel.

*M. Arnold*, *God and the Bible*, vi. § 5.

The real difference between John and the *Synoptics*, on this most decisive point, amounts to this: while these last have handed down to us but a single example of this form of language, John has preserved for us several examples selected with a particular purpose.

Such tables often proceed upon the dichotomous plan of presenting in succession alternatives of two (or more) characters, only one of which the specimen in hand should exhibit, as the "ovary inferior" and "ovary superior" in case of a plant; but the tabulation may be made in any way which best subserves the desired purpose in different cases. Some are natural analyses, others wholly artificial; the former are the more important and really instructive, the latter the most convenient and immediately helpful. Some combine these incompatible features as far as possible; and all are constantly used in systematic treatises, manuals, and text-books. They are often called *keys*.

A putting of two or more things together; composition; specifically, the combination of separate elements or objects of thought into a whole, as of simple into compound or complex conceptions, and individual propositions into a system; also, a process of reasoning advancing in a direct manner from principles established or assumed, and propositions already proved, to the conclusion: the opposite of *analysis*.

It [speech] should carry an orderly and good construction, which they called *Synthesis*. *Puttenham, Arte of Eng. Poesie, p. 130.*

Geometrical deduction (and deduction in general) is called *synthesis*, because we introduce, at successive steps, the results of new principles. But in reasoning on the relations of space we sometimes go on separating truths into their component truths, and these into other component truths, and so on; and this is geometrical analysis. *Whewell, Philos. of Inductive Sciences, II. xxiii.*

2. Specifically—(a) In *gram.*, the combination of radical and formative elements into one word, as distinguished from their maintenance in the condition of separate words. See *synthetic*, 2. (b) In *surg.*, an operation by which divided parts are united. (c) In *chem.*, the uniting of elements into a compound; composition or combination: the opposite of *analysis*, which is the separation of a compound into its constituent parts; as, that water is composed of oxygen and hydrogen is proved both by analysis and by *synthesis*. (d) In *acoustics*, the combining of two or more simple sounds of different pitch, as those of several tuning-forks to produce or imitate a certain compound sound, as, for example, that of a piano-string.—*Dynamic, pure, etc. synthesis*. See the adjectives.—*Synthesis of apprehension*. See *apprehension*.—*Synthesis of reproduction*. See *reproduction*.

**synthesise**, *v. t.* See *synthesize*.

**synthesist** (sin'the-sist), *n.* [*Gr. σύνθεσις* + *-ιστής*.] One who employs synthesis, or who follows synthetic methods. Compare *syntheticist*.

Science turns her back on the subject, and the universities dismiss Art from the category of studies, and pass it over mainly to the painters to discourse on, ignoring the psychological law that no mind can be productively analytical and synthetical at the same time, and the artist, being perforce a *synthesist*, cannot be expected to analyse the art which he is, if a true artist, occupied in building. *New Princeton Rev., II. 24.*

**synthesize** (sin'the-siz), *v. t.*; pret. and pp. *synthesized*, ppr. *synthesizing*. [*Gr. σύνθεσις* + *-ίζω*.] To combine or bring together, as two or more things; unite in one; treat synthetically. Also spelled *synthesise*.

The functions of separate organs are subsumed and *synthesized* into the activity of a yet higher unity—that of the organic system to which they belong.

*Mivart, Nature and Thought, p. 187.*

**synthetic** (sin-thet'ik), *a.* [= *F. synthétique* = *Sp. sintético* = *Pg. sintetico* = *It. sintetico*, *Gr. συνθετικός*, *Gr. συνθεσθαι*, skilled in putting together or in composition, *Gr. συντίθεσθαι*, put together: see *synthesis*.] 1. Of or pertaining to synthesis; consisting in synthesis; as, the *synthetic* method of reasoning, as opposed to the *analytical*.

In fact, all mathematical judgments are *synthetic*, or, if analytic judgments are made in mathematics, they are quite subordinate in importance.

*E. Caird, Philos. of Kant, p. 211.*

That activity which we variously call "poetic," "imaginative," or "creative" is essentially *synthetic*, is a process of putting together, while the scientific process seems distinctively analytic, or a tearing apart. *S. Lanier, English Novel, p. 69.*

2. In *gram.*, characterized by synthesis, or the combination of radical and formative elements into one word, as distinguished from their maintenance in separate words, which is *analytic*. Thus, *man's* is synthetic, *of man* is analytic; *higher* is synthetic, *more high* is analytic; *loved* is synthetic, *did love* is analytic; and so *amandatur* (Latin) and *teill* (Breton). The

epithet is used both of single formations, like these, and of classes of expressions; also of a whole language, or a period or class of languages, according as expressions of one or of the other class prevail in each case.

3. In *biol.*, of a general or comprehensive type of structure; combining in one organism characters which are to be specialized in several different organisms in the course of evolution; generalized, not specialized; undifferentiated. Thus, the *Symphyla* are a synthetic type, as combining characters of the classes *Myriapoda* and *Hexapoda*. Since the general course of evolution is from generals to particulars, or from generalization to specialization, synthetic forms are mostly low or primitive, and less fully illustrated by recent or living than by early and extinct organisms. Most fossil types are synthetic in comparison with existent forms of which they are ancestral.—*Synthetic geometry*, geometry treated without algebra, or at least without coordinates; opposed to *analytical geometry*. Modern synthetic geometry, which has been almost altogether the fruit of the nineteenth century, resembles the geometry of the Greeks, but far surpasses it in power and beauty. See *geometry*.—*Synthetic judgment or proposition*, a judgment professing to contain matter of fact, and not mere explication of what is implicitly contained in the idea of the subject.—*Synthetic method*. See *method*.—*Synthetic philosophy*, the philosophy of Herbert Spencer: so called by himself, because it is conceived as a fusion of the different sciences into a whole. See *Spencerianism*.

**synthetical** (sin-thet'i-kal), *a.* [*Gr. σύνθεσις* + *-αλ*.] Same as *synthetic*.

Before we have done, we shall see how all-efficient the *synthetical* principle proves to be. No wonder, for it is nothing less than our whole feeling, thinking, and willing subject; in fact, our very being mentally occupied.

*E. Montgomery, Mind, No. 35, July, 1884.*

The composition of water may be demonstrated by synthesis. . . . The discovery of the composition of water was indeed made originally by *synthetical*, and not by analytical processes. *Huxley, Physiology, vii.*

**Accidental synthetical mark**. See *mark*.—*Synthetical cognition*, definition, etc. See the nouns.

**synthetically** (sin-thet'i-kal-i), *adv.* In a synthetic manner; by synthesis; by composition. **syntheticism** (sin-thet'i-sizm), *n.* [*Gr. σύνθεσις* + *-ισμός*.] The principles of synthesis; a tendency to follow synthetic methods; a synthetic system.

Both are found on both coasts of the North Pacific.

[*Gr. σῖν, together, + θρόνος*, throne.] In the early church and in the Greek Church, the joint throne or seat of the bishop and his presbyters. The synthronus is placed behind the altar against the east wall of the apse, and consisted from early times of a semi-circular row or of several such rows of steps or seats, the bishop's throne or cathedra being in the center and higher than the rest. Synthroni are sometimes found in the West, usually of ancient construction. A good example is the synthronus in the basilica of Torcello. See *cut under bishop*.

1. A portable hydraulic instrument of the pump kind, commonly employed to draw in a quantity of water or other fluid, and to squirt or eject it forcibly. In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube, on this being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure, and by pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe is used by surgeons and others for washing wounds, for injecting fluids into the body, and for other purposes. A larger form is used for watering plants, trees, etc. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

3. In *anat.*, the Eustachian tube.—4. In *ornith.*, the voice-organ of birds; the lower larynx, situated at or near the bifurcation of the trachea into the bronchi, and serving to modulate the voice, as in singing. This is usually a more complicated structure than the larynx proper (at the top of the trachea), and so differently constructed in different birds that it affords characters of great significance in classification. The highest group of *Passeres* (namely, the suborder *Oscines*, which contains the singing birds) is signalized by the elaboration of this musical organ, especially with reference to its intrinsic musculature. A few birds have no syrinx; some have one, yet without intrinsic muscles; in some the syringes are wholly bronchial, and consequently paired; in others the syrinx is wholly tracheal, and single. But in nearly all birds the syrinx is bronchotracheal, and results from a special modification of the lower end of the trachea and upper end of each bronchus. The lowermost tracheal ring, or a piece composed of several such rings, is enlarged and otherwise modified, and crossed by a bolt-bar (see cut under *pesculus*), which separates the single tracheal tube into right and left openings of the bronchi. A median septum rises from the pessulus into the trachea, between the two bronchial orifices, and the free upper margin of this septum, called the *semilunar membrane*, forms the inner lip of a rima syringis, whose outer lip is a fold of mucous membrane from the opposite side of each bronchus. These membranes are vibratile in the act of singing, and constitute vocal cords. Several upper bronchial half-rings, enlarged and otherwise modified, are completed in circumference by a single continuous membrane, the *internal tympaniform membrane*, which is attached to the pessulus above. The syrinx is actuated by a pair, or several pairs, of intrinsic singing-muscles, called *syringomyia*, which vary much in different birds in their attachments as well as in their number. (See *syringomyia*.) In the *Oscines* at least five pairs are recognized, though their nomenclature is by no means settled, owing to their description under different names by different authors, and to the difficulty of homologizing the individual muscles under their many modifications in different birds. The insertion of the *syringomyia* into the ends and not into the middle of the bronchial half-rings is characteristic of the true *Oscines*. See *Aeronyx*, *Idesonyx*.

Syrinx of Raven. a, b, c, modified tracheal and bronchial rings entering into its formation; tr, trachea; br, right and left bronchi.

Shak., C. of E., v. 1. 104.

**2.** The uncrystallizable fluid finally separated from crystallized sugar in the refining process, either by the draining of sugar in loaves, or by being forcibly ejected by the centrifugal apparatus in preparing moist sugar. This is the ordinary or "golden syrup" of grocers; but in the sugar-manufacture the term *syrup* is applied to all strong saccharine solutions which contain sugar in a condition capable of being crystallized out, the ultimate uncrystallizable fluid being distinguished as *molasses* or *treacle*.—**Compound syrup**, in *med.* and *phar.*, a name applied to many, though not to all, syrups containing two or more medicaments.—**Compound syrup of sarsaparilla**, sarsaparilla 150 parts, guaiacum-wood 20 parts, pale rose 12 parts, glycyrrhiza 12 parts, senna 12 parts, sassafras, anise, and gaultheria each 6 parts, sugar 600 parts, and diluted alcohol and water each to make 1,000 parts.—**Compound syrup of squill**, squill 120 parts, senega 120 parts, tartaric acid of antimony and potassium each 3 parts, sugar 1,200 parts, precipitated calcium phosphate 9 parts, and diluted alcohol and water each to make 2,000 parts. **syssitia** (si-sit'i-ä), *n.* [NL., *< Gr. συσσίτια*, *< σύσσιτος*, eating together or in common, *< σίν*, together, + *σίτος*, food.] In ancient Greece, notably among peoples of Dorian blood, and most conspicuously among the Spartans and Cretans, the custom that full citizens should eat the chief meal of the day in a public mess. In Crete the expense was met from the public revenues, in Sparta by a contribution levied upon the heads of families. The food was, until the decadence, in general plain, and sobriety of drinking was enforced. The chief object of the syssitia was to unite the members of the ruling class by bonds of intimacy, and to give them a cohesion which furthered greatly their civil and military enterprise.

Any combination or assemblage of things adjusted as a regular and connected whole; a number of things or parts so connected as to make one complex whole; things connected according to a scheme: as, a *system* of canals for irrigation; a *system* of pulleys; a *system* of railroads; a mountain *system*; hence, more specifically, a number of heavenly bodies connected together and acting on each other according to certain laws: as, the solar *system*; the *system* of Jupiter and his satellites.

Who sees with equal eye, as God of all,

A hero perish or a sparrow fall,

Atoms or systems into ruin hurled,

And now a bubble burst, and now a world.

*Pope*, *Essay on Man*, i. 89.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. Let us instance in a watch. *Butler*, *Analogy*.

A Natural *System* is one which attempts to make all the divisions natural, the widest as well as the narrowest, and therefore applies no characters pre-emptorily. . . . An Artificial *System* is one in which the smaller groups (the Genera) are natural, and in which the wider divisions (Classes, Orders) are constructed by the peremptory application of selected Characters (selected, however, so as not to break up the smaller groups).

*Whewell*, *Philos. of Inductive Sciences*, I. p. xxxii.

For a *system*, in the most proper and philosophic sense of the word, is a complete and absolute whole.

*H. Bushnell*, *Nature and the Supernatural*, ii.

Star and system rolling past.

*Tennyson*, *In Memoriam*, Conclusion.

2. A plan or scheme according to which ideas or things are connected into a whole; a regular union of principles or facts forming one entire whole; an assemblage of facts, or of principles and conclusions, scientifically arranged, or disposed according to certain mutual relations so as to form a complete whole; a connected view of all the truths or principles of some department of knowledge or action: as, a *system* of philosophy; a *system* of government; a *system* of education; a *system* of divinity; a *system* of botany or of chemistry; a *system* of railroading: often equivalent to *method*.

There ought to be a *system* of manners in every nation which a well-formed mind would be disposed to relish.

*Burke*, *Rev. in France*.

In the modern *system* of war, nations the most wealthy are obliged to have recourse to large loans.

*A. Hamilton*, *The Federalist*, No. 30.

There was no part of the whole *system* of Government with which they [the Houses of Parliament] had not power to interfere by advice equivalent to command.

*Macaulay*, *Sir William Temple*.

I am deeply convinced that among us all *systems*, whether religious or political, which rest on a principle of absolutism, must of necessity be, not indeed tyrannical, but feeble and ineffective *systems*.

*Gladstone*, *Might of Right*, p. 102.

3. The scheme of all created things considered as one whole; the universe.—4. Regular method or order; plan: as, to have no *system* in one's business or study.—5. In *astron.*, any hypothesis or theory of the disposition and arrangements of the heavenly bodies by which their phenomena, their motions, changes, etc., are explained: as, the Ptolemaic *system*; the Copernican *system*; a *system* of the universe, or of the world.—6. In the *fine arts*, a collection of the rules and principles upon which an artist works.—7. (a) In *Byzantine music*, an interval conceived of as compounded of two lesser in-

tervals, as an octave or a tetrachord. (b) In *medieval and modern music*, a series of tones arranged and classified for artistic use, like a mode or scale. (c) In *modern musical notation*, two or more staves braced together for concerted music.—8. In *anc. pros.*, a group of two or more periods; by extension, a single period of more than two or three cola; a hypermetron. A *system* the metrical form of which is repeated once or oftener in the course of a poem is called a *strophe*.

9. In *biol.*: (a) An assemblage of parts or organs of the same or similar tissues. The principal systems of the body in this sense are the *nervous*, both cerebrospinal and sympathetic; the *muscular*, both voluntary and involuntary; the *osseous*, including the cartilages as well as the bones of the skeleton; the *vascular*, including the *blood-vascular* and *lymphatic* or absorbent; the *tegumentary*; the *mucous*, including the mucous membranes; and the *serous*, including the serous membranes. These systems may be subdivided, as the vascular into the blood-vascular and lymphatic systems; or some of them may be grouped together, as when the *connective-tissue* system includes the bones, cartilages, ligaments, tendons, and general areolar or cellular tissues of the body. Hence—(b) In a wider sense, a concurrence of parts or organs in some function. Most if not all such systems act physiologically by the concurrence of several other lesser systems: as, the *digestive* system; the *respiratory* system; the *reproductive* system. Hence—(c) In the widest sense, the entire body as a physiological unity or anatomical whole: as, to take food into the *system*; to have one's *system* out of order. (d) In *ascidiology*, the conobium of those compound tunicates which have a common cloaca, as the *Botryllidæ*. *Von Drasche*, 1883.—10. One of the larger divisions of the geological series: as, the Devonian *system*; the Silurian *system*.

The term is used by various geologists with quite different meanings, mostly, however, as the equivalent of *series*: thus, Cretaceous *system* (the Cretaceous series).

11. In *nat. hist.*: (a) In the abstract, classification; any method of arranging, disposing, or setting forth animals and plants, or any series of these, in orderly sequence, as by classes, orders, families, genera, etc., with due coördination and relative subordination of the several groups; also, the principles of such classification; taxonomy: as, the morphological *system*; a physiological *system*. There is but one adequate and natural system, namely, that which classifies animals and plants by structure alone, according to their degrees of genetic relationship, upon consideration of descent with modification in the course of evolutionary processes; it is the aim of every systematist to discover this true taxonomy and set it forth by classificatory methods. (b) In the concrete, any zoological or botanical classification; any actual arrangement which is devised for the purpose of classifying and naming objects of natural history; a formal scheme, schedule, or inventory of such objects, or a systematic treatise upon them: as, the Linnean or artificial *system* of plants; Cuvier's *system* of classification; the quinary *system*. Such systems are very numerous, and no two agree in every detail either of classification or of nomenclature; but all have in view the same end, which is sought to be attained by similar methods, and upon certain principles to which most naturalists now assent.—*Abkari system*. See *abkari*.—*Action of a moving system*. See *action*.—*Adjunct system*, a system of linear equations whose coefficients are the corresponding minors of the determinant of a primitive system.—*Allotment*, *American*, *asymmetric system*. It was based on the assumption that the body possesses a peculiar property of excitability, and that every agent capable of acting on the body during life does so as a stimulant. When these stimuli were normal in amount, the condition was one of health; if excessive, causing debility; if insufficient, causing indirect debility.—*Canonical system*, a system of differential equations of the forms

$dx_i = \frac{\partial \psi}{\partial p_i} dt, \quad dp_i = -\frac{\partial \psi}{\partial x_i} dt, \quad i = (1, 2, 3, \dots, n).$

See *Linnean*.—**Logerian system**, in music, a system of instruction upon the pianoforte invented by J. B. Logier, and patented in England in 1811. It involved two things—the use of the chiroplast, a mechanical contrivance for holding the pupil's hands in a correct position at the keyboard, and the simultaneous instruction of several pupils at as many pianofortes. The chiroplast had drawbacks which have led to its being discarded, but the plan of class instruction is in use to some extent in all music-schools.—**Lot, Macleayan, male, mark, mercantile, metamorphic, metayer, military, moiety, muscular, natural, nervous, octave system**. It is thus finally made positive that the *Taconic system* is not a pre-Silurian system, and that the claiming for it equivalency with the Huronian was but a leap in the dark. It is manifest, in fact, that "*Taconic system*" is only a synonym of the older term "*Lower Silurian*," as this term was used by geologists generally twenty, thirty, and forty years since, and by many writers till a much later date. *J. D. Dana, Amer. Jour. Sci.*, Dec., 1884, p. 411.

**Tail-robe, tarsal, territorial, tetragonal, etc., system**. See the qualifying words.—**Three-field system**. See *field*.—**Vascular system**, the circulatory system.—**Water-vascular system**. See *water-vascular*.—**Syn. 1-4. System, Method**. Strictly, "*System*" is logical or scientific collocation. *Method* is logical or scientific procedure" (*C. J. Smith, Synonyms Discriminated*). But *system* is often used for *method*; *method* is not used for *system*. *System, Range, Chain*, in *orography*, as used by physical geographers writing in English, are nearly the same thing, we find the "*Appalachian chain*" frequently called "*Appalachian range*" or "*ranges*," and also "*Appalachian system*." *System* is the more comprehensive term. All the *ranges* which go to make up a complex of mountains sufficiently nearly a unit, as popularly designated, to be embraced under one name, may be called a *system*: thus, the *ranges* of the Great Basin, some twenty or more in number, may properly all be classed together as forming the Great Basin "*mountain system*," or simply "*system*."

As thus defined, the Appalachian Region, *System*, or complex of *ranges*, extends from the promontory of Gaspe, in a mean direction of northeast and southwest, to Alabama—a distance of about 1,200 miles—where it disappears entirely, becoming covered by the much more recent geological formations, which form a broad belt along the Gulf of Mexico, and extend far up the Mississippi Valley. *J. D. Whitney, The United States*, p. 32.

In *astron.*, the conjunction or opposition of a planet with the sun, or of any two of the heavenly bodies. On the phenomena and circumstances of the syzygies depends a great part of the lunar theory.—2. In *anc. pros.*, a group or combination of two feet. Ancient metricians varied in their use of this term. Some use it regularly for a dipody or (dipodic) measure. Others call a tautopody, or double foot, a dipody, but a combination of two different feet a syzygy. Some, accordingly, giving the name *syzygy* to tetasyllabic feet (regarded by them as composed of two dissyllabic feet), speak of an iambic or a trochaic line as measured by dipodies, but an Ionic line as measured by syzygies—that is, by single Ionics considered as combinations of trochees and pyrrhics. A peculiar use is the restriction of the term *syzygy* to compound feet of five or six syllables.

3. In *alg.*, a linear function in the variables. See *syzygetic*.—4. In *zool.*, the conjunction of two organs or organisms by close adhesion and partial concrescence, without loss of their identity; also, the thing so formed, or the resulting conformation; a syzygium: a term variously applied. (a) Zygosis or conjugation, as observed in various protozoans and other low organisms. See *conjugation*, 4, *Diplozoon*, and *diporpa*. (b) Suture, or fixed articulation, of any two joints of a crinoid ray, or the joints thus sutured, with partial obliteration of the line of union.

Syzygy of *Diplozoon paradozum*.

The first of the brachial joints [in the *Pentacrinus asper*]—that is to say, the joint immediately above the radial axillary—is, as it were, split in two by a peculiar kind of joint, called by Muller a "*syzygy*." All the ordinary joints of the arms are provided with muscles producing various motions, and binding the joints firmly together. The *syzygies* are not so provided, and the arms are consequently easily snapped across where these occur. *Sir C. Wyville Thomson*, *Depths of the Sea*, p. 440.

**Epirrhematic syzygy**, in *anc. pros.*, the last four parts of the parabasis—that is, the strophe or ode, epirrhema, antistrophe or antode, and antepirrhema: the choric as distinguished from the monodic parts of the parabasis.

Systyle and Areosystyle Dispositions of Columns.

A Systyle the intercolumniations (a) equal to two diameters. B Areosystyle the intercolumniations (a) of the coupled shafts equal to one and a half diameters, those (b) of the alternate columns equal to three and a half diameters.

1. The twentieth letter and sixteenth consonant of the English alphabet. Of the Phœnician alphabet the corresponding sign was the twenty-second and last; what follows *t* in Greek and Latin, and also in our own scheme, is the result of successive additions made to the system borrowed from Phœnician. (See the several letters below.) The comparison of forms (compare *A*) is as follows:

δ Egyptian Hieroglyphic. ς Hieratic. ϑ Phenician. Τ Greek and Latin.

The value of the sign has been practically the same through the whole history of its use; it denotes the surd (or breathed) mute (or check) produced by a complete closure (with following breach or explosion) between the tip of the tongue and a point on the roof of the mouth either close behind or not far from the bases of the upper front teeth. Its corresponding sonant or voiced mute is *d*, and its nasal is *n* (see these letters). They are often called *dental* or *teeth-sounds*, though the teeth have really no part in their production; hence also, and better, *lingual*, or *front lingual*, or *tongue-tip*, etc. They are much more common elements of our utterance than either of the other two classes, palatal (*k, g, ng*) or labial (*p, b, m*); they constitute, namely, about 18 per cent. of the sounds we make (*t* nearly 6 per cent., *d* nearly 5, *n* nearly 7), against palatal 4 per cent., and labial 6. A sound which our ears would at once recognize and name as a *t*-sound is producible in other positions of the organs than that described above—namely, at points further back on the roof of the mouth, and with parts of the tongue behind the tip, and even of its under surface. Hence the occurrence in some languages of more than one *t*, distinctly recognized as separate members of the spoken alphabet (so two in Sanskrit, etc., and even four in Siamese); our own *t* also which forms the first part of the compound *ch* (= *tsh*) is slightly but constantly different from our *t* elsewhere. As in many other languages (and partly by direct inheritance from French, and even from later Latin, alterations), the *t* in English shows a tendency to become palatalized and converted into a sibilant when followed by palatal sounds, as *i, e, y*. Hence, in many situations, it combines with such sounds, either regularly or in rapid utterance, producing the *ch*-sound, as in *question, mixture* (compare the corresponding conversion of *s* to *sh*, under *Sy*); and even, in a great number of words having the endings *-tion, -tious, -tial, etc.*, it becomes a sibilant and makes the *sh*-sound, as in *nation, factions, partial, etc.* *T* also, like others of our consonants, frequently occurs double, especially when medial: thus (from *fit*) *fitted, fitter, fitting*. With *h*, *t* forms the digraph *th*, which has the position and importance of a fully independent element in the alphabet, with a double pronunciation, surd and sonant (or breathed and voiced): surd in *thin, breath*; sonant in *this, breathe*—both as strictly unitary sounds as *t* and *d*, or *s* and *z*. They are related with *t* and *s*, etc., as tongue-tip sounds, especially with *s* and *z* as being fricative and continuable; but they are of closer position than the latter, the closest that can be made without actual stoppage of the breath, and are usually formed with the tongue thrust further forward, against or even beyond the teeth: hence their substitution for *s* and *z* by persons who lisp. In regard to their grade of closure, they are akin to *f* and *r*, and belong in one class with these (oftenest and best called *spirants*). As an *f* comes in part from an aspirated *p*, or *ph*, so also the *th*-sounds from an aspirated *t*; and in this way they have obtained their usual representation: the Greek *θ*, which was an aspirated *t* (that is, a *t* with separately audible *h* after it), was written in Latin with *th*, and then, when the aspirate came to be pronounced as a spirant, this was continued in use as representative of the latter. And in this case the Latin digraph has crowded out of English use the sign (or rather the two signs) which in Anglo-Saxon represented the *th*-sounds—namely, *þ, ð*—much to the detriment of our present alphabet. Of the two *th*-sounds, the sonant (or *this* and *breathe* sound) is much the more frequent, owing chiefly to the constant recurrence of the pronominal words, particularly *the*, in which it is found; it is nearly 4 per cent. of our utterance, while the surd (or *thin* and *breath* sound) is less than two thirds of one per cent. In the phonetic history of the Germanic part of our language, *t* regularly and usually (when special causes do not prevent) comes from an older *d*; and, on the other hand, *th* from an older *t*: examples for *t* are *two* corresponding with *duo*, *eat* with *ad* or *ed*; for *th*, *thou* = *tu*, *three* = *tri*, *beareth* = *fert*; for both together, *that* = *tad*, *tooth* = *dent*.

Specifically—(a) A flap, strap, or latchet of a shoe. (b) The tag at the end of a shoe-lace. II. *n*. A fly of the family *Tabanidæ*; a horse-fly; a deer-fly; a gadfly or breeze.

*Tabanidæ* (*ta-ban'i-dē*), *n. pl.* [NL. (Leach, 1819), < *Tabanus* + *-idæ*.] A large family of biting flies, of which *Tabanus* is the typical genus; the gadflies, breezes, or clegs, having the third joint of the antennæ annulate and without a distinct bristle. The proboscis of the female is adapted for piercing and inflicts a painful although not irritating wound. The male does not bite. They fly with extraordinary speed, and the swiftest horse cannot elude them. The spindle-shaped brown or black eggs are attached in groups to the stems and leaves of low-growing plants, and the larvae are either aquatic or live in damp earth. They are predaceous, and feed upon snails or small insects. The young larvae of many species penetrate beetles and other larvae, and remain within until they have entirely consumed them. Over 1,300 species are known; 150 are North American. Many of them are among the largest and most powerful of the *Diptera*, but most are of moderate size. They fly in bright sunny weather. Nearly 100 species inhabit North America. *T. atratus* is the common large black horse-fly of the United States; *T. bovinus* is the common gadfly of cattle. See cuts under *breeze* and *gadfly*.

**Tabebuia** (tab-ē-bū'ijū), *n.* [NL. (Gomez, 1803), from Braz. name.] A genus of gamo-

petalous plants, of the order *Bignoniaceae*, tribe *Tecomneae*, and section *Digitifoliae*. It is characterized by loosely racemose or cymose flowers with a tubular and at length variously ruptured calyx, an elongated and greatly enlarged corolla-tube, four perfect stamens, and a sessile ovary ripening into a somewhat cylindrical ecostate capsule with numerous flat seeds, each with a large hyaline wing. There are about 60 species, natives of tropical America from Brazil to the West Indies and Mexico. They are erect shrubs or trees, smooth or hairy, often drying black. They bear usually large flowers and alternate or scattered leaves, which are generally composed of five to seven digitate leaflets, sometimes reduced to three or to one. Several species are used medicinally, as *T. im-petiginosa*, which yields a bitter mucilaginous bark and abounds in tannin. Many are valuable trees, yielding an almost indestructible timber; several are known in tropical America as *roble*—that is, *oak*—and are used for house- and ship-building, or for making bows, as *T. toxophora*, the *pa-o'-arco* of Brazil. The names *whitewood* and *box-wood* are given to *T. Leucocorylon* in the West Indies, and the former name also to *T. pentaphylla*; both are timber-trees with whitish bark and white or pink flowers. *T. serratifolia*, a small tree with yellow flowers, is known as *pony* in Trinidad. All the above species were formerly classed under *Tecoma*, but are removed to *Tabebuia* on account of their digitate, not pinnate, leaflets. A very different species, *T. uliginosa*, a shrub with simple entire leaves, is known as *Brazilian cork-tree*, from the use of its soft wood.

**tabefaction** (tab-ē-fak'shon), *n.* [*< LL. as if "tabefactio(n)-"*, *< tabefacere*, pp. *tabefactus*, melt: see *tabefy*.] A wasting away or consumption of the body by disease; emaciation; tabescence; tabes.

**tabernacle** (tab'ēr-nā-kl), *n.* [*< ME. tabernacle*, *< OF. (and F.) tabernacle = Pr. tabernacle = Sp. tabernáculo = Pg. tabernaculo = It. tabernacolo*, *< L. tabernaculum*, a tent, LL. (Vulgate) the Jewish tabernacle, dim. of *taberna*, a hut, shed, booth; from the same root as *tabula*, a table, tablet: see *tavern*, *table*.] 1. A tent; a pavilion; a booth; a slightly constructed habitation or shelter, either fixed or movable; hence, a habitation in general, especially one regarded as temporary; a place of sojourn; a transient abode.

The *tabernacle* of the upright shall flourish.

Prov. xiv. 11.

Let us make here three *tabernacles*, one for thee, and one for Moses, and one for Elias. *Mat. xvii. 4.*

The body . . . is but the *tabernacle* of the mind.

*Dæcon*, *Advancement of Learning*, ii.

2. In *Biblical phraseology*, the human frame as the temporary abode of the soul, or of man as a spiritual immortal being.

Yea, I think it meet, as long as I am in this *tabernacle*, to stir you up by putting you in remembrance, knowing that shortly I must put off this my *tabernacle*, even as our Lord Jesus Christ hath shewed me. *2 Pet. i. 13, 14.*

3. In *Jewish hist.*, a tent constructed to serve as the portable sanctuary of the nation before its final settlement in Palestine. This "tabernacle of the congregation" is fully described in Ex. xiv.-xxvii. and xxxvi.-xxxviii. It comprised, besides the tent, an inclosure or yard, in which were the altar of burnt-offerings and the laver. The tabernacle proper was a tent divided into two chambers by a veil—the inner chamber, or holy of holies, containing the ark of the covenant and the mercy-seat, and the outer chamber the altar of incense, the table of showbread, and the golden candlestick. The tabernacle was of a rectangular figure 45 feet by 15, and 15 feet in height. The court or yard was 150 feet in length by 75 feet, and surrounded by screens 7½ feet high. The people pitched round the tabernacle by tribes in a fixed order during their wanderings, and the pillar of cloud and of fire, denoting Jehovah's presence, rested upon it or was lifted from it according as they were to remain stationary or were to go forward. After the arrival in the promised land it was set up in various places, especially at Shiloh, but gradually lost its exclusive character as the center of national worship before the building of Solomon's temple, in which its contents were eventually placed.

And he spread abroad the tent over the *tabernacle*, and put the covering of the tent above upon it. *Ex. xl. 10.*

And they brought up the ark [to the temple built by Solomon], and the *tabernacle* of the congregation [tent of meeting, R. V.], and all the holy vessels that were in the *tabernacle*, these did the priests and the Levites bring up. *2 Chron. v. 5.*

Hence—4. A place or house of worship; especially, in modern use, an edifice for public worship designed for a large audience: often now the distinctive name assumed for such an edifice.

The shed in Moorfields which Whitefield used as a temporary chapel was called "The *Tabernacle*"; and, in the scornful dialect of certain Church-of-England men, Methodist and such-like places of worship have, since then, been known as *tabernacles*.

*F. Hall*, *False Philol.*, p. 24, note.

5. A receptacle for the reserved eucharist; especially, a constructional receptacle for this purpose, containing the pyx. The tabernacle, as now commonly seen in Roman Catholic churches, is a recess with a door, placed over and behind the high altar or one of the side altars, usually having over it a cross or crucifix with a design in relief, the whole surmounted by a canopy. In earlier times a movable ark, or usually a suspended dove (columba) or a tower, held the eucharist or the vessel containing it. In England the general medieval custom was to place the sacrament in an ambry on one side of the sanctuary or in the sacristy. The tabernacle is a later development of the ark or ambry as a permanent construction over the high altar and surmounted by a canopy or ciborium, often in the spire-like shape developed from the older tower; hence the name *tabernacle* is often given especially to this canopy or to canopies of similar appearance.

6. In *medieval arch.*, a canopied stall, niche, or pinnacle; a cabinet or shrine ornamented with

7. *Naut.*, an elevated socket for a river-boat's mast, or a projecting post to which a mast may be hinged when fitted for lowering to pass beneath bridges. [Eng.]—**Feast of Tabernacles**, among the Jews, an annual festival celebrated in the autumn (on the fifteenth day of Tisri) in commemoration of the dwelling of their people in tents during the journey in the wilderness, and as a feast of thanksgiving for the harvest and vintage. Among the ancient Jews it

lasted eight days, during which all the people gathered at Jerusalem and dwelt in booths. (See Lev. xxiii. 34-36; Num. xxix. 12-39.) Among the modern Jews the feast has been prolonged one day.

(Used scornfully in the quotation, with reference to so-called Methodist tabernacles. See *tabernacle*, 4.)

**Tabernæmontana** (tā-bér'nē-mon-tā'nj), *n.* [NL, named after Jacobus Theodorus *Tabernæmontanus*, a German physician and botanist (died 1590).] A genus of gamopetalous plants, of the order *Apocynaceæ* and tribe *Plumeriaceæ*, type of the subtribe *Tabernæmontanææ*. It is characterized by cymose flowers, a calyx furnished at the base of its five lobes with a continuous or interrupted ring of glands, and a fruit of two many-seeded berries or fleshy follicles which are large and globose or smaller and oblique or recurved. There are about 150 species, widely scattered through tropical regions. They are trees or shrubs, commonly smooth, bearing opposite thin or coriaceous feather-veined leaves. The small cymes of white or yellowish salver-shaped flowers are terminal or variously placed, but not truly axillary. The smooth or three-ribbed pulpy fruit contains several or many ovoid or oblong seeds with fleshy albumen: in several species it is ornamental—in *T. macrocarpa* and others of the section *Rejoua*, mainly of the Malay archipelago, resembling a reddish orange in appearance. Instead of the acid, drastic, and poisonous milky juice of most related genera, many species of *Tabernæmontana* secrete a bland and wholesome fluid, sometimes useful as a nourishing drink, as in *T. utilis*, the cow-tree or hya-hya of British Guiana, which yields a thick, sweet, white liquid, made somewhat sticky by the presence of caoutchouc. This species also yields a soft white wood and a medicinal bark. *T. orientalis*, the Queensland cow-tree, and *T. coronaria*, known as *Adam's apple* or *East Indian rose-bay*, are sometimes cultivated, forming small evergreen trees, the latter under glass and also naturalized in tropical Asia from the Cape of Good Hope. Several other species are cultivated under glass for their large fragrant flowers and ornamental deep-green leathery leaves. *T. crassa*, the kokpokoka-tree of Sierra Leone, produces a fiber there made into a cloth known as *dodo-roth*. A species in Ceylon, known as *divi-divi*, probably *T. dichotoma*, has been called *forbidden fruit*, from its beautiful but poisonous fruit bearing marks fancied to be the prints of the teeth of Eve.

4. In music: (a) The system of rules for the poetry of the mastersingers. (b) Musical notation in general. (c) A form of musical notation for various instruments, like the lute, the viol, the flute, the oboe, or the organ, used in Europe from the fifteenth to the beginning of the eighteenth century. It differed from the more general staff-notation in that it aimed to express not so much the pitch of the tones intended as the mechanical process by which on the particular instrument those tones were to be produced. Tablature, therefore, varied according to the instrument in view. In the case of the lute, for example, a horizontal line was usually drawn for each string, forming a kind of staff; and letters or numerals were placed on these lines, indicating not only which strings were to be touched, but at what frets they were to be stopped. Various arbitrary signs were also used instead of letters or numerals, or in combination with them. Music thus noted was said to be written *lira-way*, in distinction from *gamut-way* (in the staff-notation). In the case of wind-instruments, like the

flageolet, points or dots were often placed on horizontal lines to indicate which finger-holes were to be closed to produce the required tones. In the case of the organ, notes were often written out by their letter-names. In all these systems and their numerous variants, marks were added above or below to indicate the desired duration of the tones, the place and duration of rests, and various details of style. Tablature had obvious advantages as a notation for particular instruments. Various technical marks now used are either derived from it or devised on the same principle. The tonic sol-fa notation, that of thorough-bass, and the little-used systems of numeral or character notes are essentially analogous to it. Also *tabulature*.

## table

—Moving table, in machines for grinding sheet-glass,  
a large rectangular paneled frame, working horizontally,  
and pivoted centrally to an oscillating arm which has at  
the other end a fixed bearing. It receives motion from  
a crank and pitman, the latter being pivoted to the mov-  
ing table at a considerable distance from the first-named  
pivot. This arrangement produces a motion of the table  
analogous to that of hand-rubbing. The moving table is  
weighted on the upper side, and faced on the under side  
with slate, and it works over a large flat bed. In use, a  
plate of glass is cemented to the slate face of the mov-  
ing table and another to the bed. The upper plate is  
then rubbed upon the lower, the grinding commencing  
with the use of coarse emery. This is succeeded by the  
use of finer grades. The final polishing is done by an-  
other process.—Multiplication table. See *multiplica-*

or more solid-looking pedestals, which are generally cup-

usually two in number.—Pembroke table, a table the  
top of which is divided into a fixed central part and two  
leaves, which are hinged to the sides of the fixed part and  
made to be folded down, so that the table may take up  
but little room when not in use. The leaves, when raised,  
were supported originally by a sort of frame, swinging on  
a hinge or on pivots, and with a leg reaching the floor, thus  
making an additional leg of the table for each of the  
leaves. For this movable frame a hinged or sliding bracket  
is now often substituted.—Pillar-and-claw table, a ta-  
ble with a central support like a pillar, to the top of which  
the slab or top of the table is usually hinged: the pillar  
rests on three, four, or more feet, originally carved to re-  
present the paws and claws of animals.—Pythagorean ta-  
ble. See *Pythagorean*.—Round table. (a) A circular ta-

tions might be set aside for the time: in distinction from  
the ordinary long table, at which comparative rank was  
indicated by the distance of the guest's seat from the top  
or head, or above or below the salt. (b) A body of knights  
fabled to have been brought together by King Arthur  
Pendragon to defend Christian England and Wales against  
the heathen Saxons. This legendary order of Knights of  
the Round Table was initiated in later times by associa-  
tions of participants in jousts or tournaments.

Roman Catholic, Anglican, and some other churches). (b)  
By metonymy, the Lord's Supper, or communion, itself.

Ye cannot be partakers of the Lord's table and of the  
table of devils. *1 Cor.* x. 21.

The ancient writers used both names [holy table, altar]

same sentence together. *Bingham, Antiquities*, viii. 6.

should only fall in my vain attempt. *Dryden*.

**tacamahac**, **tacmahack** (tak'ā-mā-hak, tak'mā-hak), *n.* [= *Sp. tacamaca*, *tacamaha*, formerly *tacamahaca*; a S. Amer. name.] 1. A gum-resin, the product of several trees, originally that of one or more South American species. The most important *tacamahac* is derived from *Cataphyllum Inophyllum*, of the East Indies, Polynesia, etc. (see *tamara*), of which the *C. Tacamahaca* of Madagascar and the Isle of Bourbon is a variety. The resin is of a greenish-yellow color, liquid at first, but hardening into a brittle aromatic mass soluble in alcohol and ether. It exudes spontaneously or through incisions from the bark and roots. A similar gum is afforded by *C. Calaba* in the West Indies. The South American *tacamahac* is the product of *Bursera (Elaphrium) tomentosa* and *B. excelsa*, of *Protium (Icica) heptaphyllum*, and perhaps of some other trees. The buds of *Populus balsamifera* (see def. 2) are varnished with a resin which may be included under this name, occasionally used in the place of turpentine and other balsams. *Tacamahac* is sometimes used for incense, was formerly an esteemed internal remedy, and may still be somewhat used in plasters, but is very little in the market. In this sense often *tacamahaca*.

2. The balsam poplar, *Populus balsamifera*, found from the northern borders of the United States to Alaska: in the variety *candicans* known as *balm of Gilead*, and common in cultivation. It is a large broad-leaved poplar with fragrant buds.

**Tacca** (tak'ī), *n.* [NL. (Forster, 1776), from the Malay name.] A genus of plants, type of the order *Taccaceæ*, distinguished by its fruit, which is a berry, commonly three-angled or six-ribbed. It comprises nine tropical species, of which three are American, the others of the Old World. They are perennial herbs from a tuberous or creeping rootstock, with large radical leaves which are entire, lobed, or dissected, and a dense umbel of brown, lurid, or greenish flowers terminating in an erect leafless scape, and involucre with an exterior row of herbaceous or colored bracts. The numerous inner bracts are long, filiform, and pendulous, and have been erroneously regarded as sterile pedicels. *T. pinnatifida*, the plant or Otahitei saleplant, yields a nutritious starch, the South Sea arrowroot. (See *pta*.) Its leafstalks are boiled and eaten in China and Cochinchina; in Tahiti they are dried and plaited into bonnets. Other species, thought to be valuable as starch-plants, occur in Australia, India, Madagascar, Guinea, and Guiana. Several species were formerly separated as a genus *Ataccia* (K. B. Presl, 1830), having entire leaves and a spreading perianth.

It includes, besides *Tacca* (the type), only the monotypic Chinese genus *Schizocapsa*, distinguished by its different fruit—a three-celled capsule.

The mercury in the tube descends at the same time, and the degree of this descent is measured by a scale attached to the tube. The velocity of the machine being lessened, the mercury rises in the center, causing a proportionate rise in the tube. (b) An instrument for measuring the velocity of running water in rivers, etc., as by means of its action on a flat surface connected with a lever above the surface carrying a movable counterpoise, or by its action on the vanes of a wheel, whose revolutions are registered by a train of wheelwork; a current-measurer. **tail**¹ (tä), *n.* [C. ME. *tail*, *tail*, < AS. *taeg*, *taegl* = OHG. *zagal*, *zagil*, MHG. *zagel*, *zail*, *zeil*, tail, also sting, G. dial. *zagel*, contr. *zal*, tail, = Icel. *tagl* = Sw. *tagel*, hair of the tail, = Goth. *tagl*, hair; origin uncertain.] 1. The posterior extremity of an animal, in any way distinguished from the rest of the body; the hind end or hinder part of the body, opposite the head; especially, the coccygeal region or caudal appendage, when prolonged beyond the rest of the body. More particularly—(a) In mammals generally, the cauda, which may be a mere stump, or a slender appendage longer than the rest of the body. It consists of an indefinitely numerous series of coccygeal vertebrae with usually elongated bodies and reduced or aborted processes or neural canal, covered with flesh, etc., and enveloped in integument frequently hairy, like the rest of the body. These vertebrae resemble the joints or phalanges of a finger, and the whole organ is usually flexible, and may be prehensile, like a hand. In mammals without hind limbs, as cetaceans, the tail is the small or tapering hind part of the body ending in the flukes, or the flukes themselves. (b) In birds, the tail-feathers collectively. (c) In reptiles, the prolongation of the body behind the anus, of whatever character. In reptiles with legs as crocodiles, turtles, most lizards, and nearly all batrachians, the tail obviously corresponds to the part so named in mammals; it is often extremely long, slender, flexible and lash-like, and generally flaglike. It may be sometimes replaced by a new growth when broken off. In serpents and other limbless reptiles the tail is marked by the position of the anus as indicating the end of the body-cavity; it is solid and muscular, and often differently scaled from the parts in advance of it. (d) In fishes (as in cetaceans, above), the tail is the postabdominal part of the body, behind the anus, usually tapering and ending in the caudal fin; also, this fin itself in some cases. In such fish-like vertebrates as the rays, the tail is often a long, slender, whip-like appendage, well distinguished from the rest of the body. See cuts under *fish* and *diphyccerol*. (e) In crustaceans, the abdomen or abdominal region, with its appendages; the part of the body which succeeds the cephalothorax; the urosome. It is usually conspicuous, and may be longer than the rest of the animal. It is well marked in the macrurous or long-tailed crustaceans, as lobsters, prawns, shrimps, crawfish, etc., consisting of a series of flexible segments with appendages in the form of swimmerets, a rhipidura, a telson, etc. In the short-tailed or brachyurous crustaceans, as crabs, the tail is reduced and folded closely under the body, forming the apron. (f) In insects, the end of the abdomen, in any way distinguished: the pygidium; the claspers; the ovipositor, etc.; as the bee creates a sting in its tail. (g) In many arachnids, as scorpions, a well-marked abdominal or postabdominal region of the body, behind the thorax: its character is similar to that of the tail of a crustacean. (h) In worms, etc., the tail-end, or any part of the body away from the head. It is sometimes well marked, as in *Cephalobranchia*. Compare *tag-tail*, 1. (i) The buttocks. [Low.]

2. In the Turkish empire, a horsetail, or one of two or three horsetails, formerly borne as a standard of relative rank before pashas, who were accordingly distinguished as pashas (or bashaws) of one, two, or three tails.—3. A tail-like appendage or continuation; any terminal attachment to or prolonged part of an object comparable to the tail of an animal: as, the tail of a kite, or of the letter *y*; the tail of a coat (a coat-tail), or (colloquially) of a woman's long dress.

The tails of certain letters are curved, the curve being represented on the refractory terra cotta by two scratches, which together form an angle. *Science*, XVI. 172.

(2) The outer corner of the eye; the exterior canthus: more fully called *tail of the eye*. (b) In *entom.*, one of the long slender prolongations backward of the wings, as of a butterfly or moth: more fully called *tail of the wing*. See cut under *Papilio*. (c) Some elongated flexible part or appendage, as a proboscis or footstalk. (d) In *astron.*, the luminous train, often of enormous length, extending from the head of a comet in a direction nearly opposite to that of the sun. (e) In *bot.*, any slender terminal prolongation, as the appendage to the seeds of *Clematis*, *Juncus*, etc., or the linear extension from the base of the anther-lobes in many *Compositae*. Said also sometimes of a petiole or peduncle. (f) In *musical notation*, same as *stem*¹, 6. (g) *Naut.*, a rope spliced round a block so as to leave a long end by which the block may be attached to any object. See *tail-block*.

4. Something formed like a tail; an arrangement of objects or persons extending, or imagined to extend, as a tail or train. Specifically—(a) A long curl, braid, or gathering of hair: also called a *cue* or *queue*, or a *pigtail*, when hanging down behind in a single strand.

**tail-feather** (tāl'fērn'ēr), *n.* One of the feathers of a bird's tail; specifically, the rectrices, or rudder-feathers, usually stiff pennaceous feathers, always devoid of a hyporachis, as distinguished from the rectrices or tail-coverts. Tail-feathers, like flight-feathers, have for the most part a wide inner and narrow outer vane, and when the tail is closed or folded they overlap one another alternately from side to side. The two middle feathers, whose webs are more nearly equal, and which overlap all the rest, are sometimes distinguished as *deck-feathers*. Tail-feathers are always paired, and hence of an even number. The number prevailing among birds is 12; this is characteristic, having few exceptions among all *Passeres*, whether oscine or clamaratorial, and among many other birds, as birds of prey. In picarian birds 10 is the rule, though many have 12, and a few only 8; woodpeckers have 12, though apparently 10, one pair being rudimentary. In pigeons the rule is 12 or 14; sometimes there are 16 or 20. In gallinaceous birds the numbers run from 12 to 18 or 20. Waders have usually 12, often more, up to 20. Swimming-birds have sometimes only 12, usually higher numbers, as 16, 18, 20, 24, or even 32. The archæopteryx appears to have had 40. In a few birds the tail-feathers proper are extremely modified, as in the lyre-bird. (See *Menura*, *Trochilidae*.) Tail-feathers which project far beyond the rest are said to be *long-exserted*. Shapes of individual rectrices are described as *truncate*, *incised*, *linear*, *acute*, *acuminate*, *filamentous*, *spatulate*, *micronate*, etc. (See these words.) The relative lengths of rectrices go far to determine the shape of the tail as a whole, which is usually in the form of a fan. The termination of the tail is described as *even*,

## tail-feather

truncate, acute, acuminate, cuneate, forked, forficulate, furcate, emarginate, rounded, double-rounded, double-forked, etc. When the tail-feathers of opposite sides come together vertically, as in the rare but familiar case of the barn-yard fowl, the tail is said to be *complicate* or *folded*. The same tendency in the reversed direction results in the *scaphoid* or *boat-shaped* tail. A tail-feather spatulate at the end is called a *racket*. Some tail-feathers are coiled, *circinate* or *scorpioid*; others form a lyrate figure. A few birds, as grebes, have only rudimentary or no proper tail-feathers. The word is loosely extended to include tail-coverts in some cases. See cuts under *boat-shaped*, *Cin-cinnurus*, *lyre-bird*, *Sappho*, *Spathura*, and *Topaza*.

**tail-fin** (tāl'fin), *n.* In *ichth.*, the caudal fin.

**tailor-bird** (tāl'lor-bērd), *n.* One of various small passerine birds of the Oriental or Indian region, noted for the ingenuity with which they sow leaves together to form a nest. ter in 1781 as *Motacilla sutoria*, and given a French name by Sonnini in 1782, with reference to the two long middle tail-feathers. These descriptions furnished two nominal species, long known as *Sylvia sutoria* and *S. longicauda* respectively, till Horsford in 1820 founded a genus *Orthotomus* upon *O. sepium*; after which the original tailor-warbler was usually placed in *Orthotomus*, and received in the course of time several other specific designations. In 1851 Nicholson founded the genus *Sutoria* upon the original type species of Forsker, Sonnini, and Latham; and in 1831 Lesson founded a nominal genus *Edla* upon a species of *Orthotomus*. The result of this by no means remarkable confusion in generic names is that the species of *Sutoria* proper have usually been called *Orthotomus*. (a) There are 3 species of *Sutoria*, or tailor-birds proper: *S. sutoria* or *S. longicauda* (mostly called *Orthotomus sutorius* or *O. longicauda*), throughout India and Ceylon, in parts of China, in Formosa, Hainan, etc.; *S. edla* of Java; and *S. maculicollis* of the Malay peninsula. The deflected uses of the word in ML. and Rom. are due in part to the fig. sense 'wealth,' and in part to the sense 'gift, endowment,' suggested by the parable of the talents (Mat. xxv.).] 1. An ancient denomination of weight, originally Babylonian (though the name is Greek), and varying widely in value among different peoples and at different times. All the Assyrian weights had two values, the heavy being double the light, and there were also various types of each. The royal Babylonian commercial talent (or Assyrian talent) was divided into 60 minas, and each mina into 60 shekels. Its value (light weight) was in one type 29.63 kilograms (65 pounds 5 ounces avoirdupois), and in another 30.10 kilograms (66 pounds 5½ ounces). Derivatives of this talent (which was equivalent to 3,000 shekels) were in use in Syria and Palestine and in Phœnician colonies. Its money value is reckoned as approximately from \$1,700 to \$2,000. The Babylonian gold talent contained only 50 minas, and was thus five sixths of the commercial weight. The Babylonian silver talent was formed by multiplying the commercial talent by 13½ (the ratio of silver to an equivalent mass of gold), and afterward dividing by 10. The resulting light talent was sometimes again divided by 2. Derivatives of this talent were in use in Persia, Lydia, Macedonia, and Italy. It is the basis of much of the most ancient silver coinage. The Phœnician silver talent, probably derived from the Babylonian, was in its lighter types about 43.4 kilograms (95 pounds 9 ounces avoirdupois), and, being halved, was adopted into the Ptolemaic system. The chief Greek talents were as follows: Old Æginetan, 40.3 kilograms (88 pounds 12 ounces); emporic Attic (substantially later Æginetan), 36.4 kilograms (80 pounds 4 ounces); Solonic (= Egyptian), 25.8 kilograms (56 pounds 14 ounces). Talents mentioned by Homer and some other of the oldest writers appear to be small weights, perhaps shekels. The later Attic talent contained 60 minas, or 6,000 Attic drachmas, equal to 56 pounds 14 ounces. As a denomination of silver money it was equal to about \$1,000. The great talent of the Romans is computed to be equal to £99 Gs. 8d. sterling, or about \$480, and the little talent to £75 sterling, or about \$363.

According to Skeat, the ME. *talken* is derived from Sw. *tolla* = Dan. *tolla*, interpret, explain, = Icel. *tulla*, interpret, plead one's case, < Sw. Dan. *toll* = Icel. *tollr* = D. MHG. *toll*, an interpreter (ME. *toll*, *tull*, a man), < Lith. *tulkas*, an interpreter (see *toll*); but this notion is inconsistent with the form of the verb (no ME. form \**toll* appears in either sense 'talk' or 'interpret'), with phonetic laws (ME. \**toll* would not change to *talken*, and would not produce a mod. form *tall*, pron. tak), and with the sense 'talk' and 'interpret' being by no means identical or adjacent notions). The fact that the formative *-k* is not common in ME. is not an argument against its admission in this case, inasmuch as it does actually occur in *stak*<sup>1</sup>, *smurk*<sup>1</sup>, and other cases. Some confusion with a ME. \**toll*, which, though not found, is paralleled by a MD. *toll*, interpret, expound, may have occurred.] **I. intrans.** 1. =*Syn.* 1 and 2. *Heck, Tall, Lofty*. *High* is the most general of these words, and it is some uses different from those of the others. When we say that a cloud is *high*, we may mean that it extends very far upward, or, more probably, that it is unusually far above the earth. *Tall* describes that which is slim in proportion to its height, as a mast, a pine or other tree, a steeple, a person possibly a cliff: *tall* houses may be found in some parts of the world; a *tall* cloud would be of small width and great comparative height. *Tall* is also associated with height to which we are used or which we have come to regard as standard. A giant is *tall*, because so much *taller* than most men. *Lofty* denotes an imposing height: a room cannot well be *tall*, but may be *high*, or even *lofty*—as, the *lofty* arches of Westminster Hall. *Heck* and *lofty* may have application to moral or intellectual character, *tall* has not, except colloquially. *Tall* seems somewhat figurative when applied to that which does not live and grow.

A piece of wood on which notches or scores are cut to mark numbers, as in keeping an account or giving a receipt; loosely, anything on which a score or an account is kept. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In purchasing and selling it was customary to make duplicate tallies of the transaction, or to split one tally through the middle. In the English Exchequer tallies were used till 1812, which answered the purpose of receipts as well as simple records of matters of account. An Exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches indicating the sum for which the tally was an acknowledgment. On two other sides, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction were written by an officer called the writer of the tallies. This being done, the rod was then split longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counterfoil* or *counterstock*, was kept in the Exchequer, and only the other, the *stock*, issued. When the part issued was returned to the Exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This was called *tally* or *tallies*. The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit.

Alas! I cannot pay a jot; therefore  
I'll kisse the *tally*, and confesse the score.  
*Herrick*, To God.

Have you not seen a Baker's Maid  
Between two equal Panniers sway'd?

But, forc'd from this inactive State,  
On either side you hear 'em clatter.

3. A mark made to register a certain number of objects; one of a series of consecutive marks by which a number of objects are recorded or checked; also, a number as thus recorded; a number serving as a unit of computation. Thus, when packages of goods of uniform size and character are being delivered and an account of them taken, every fifth mark usually is called *tally*, and in counting aloud the word *tally* is used instead of five, after which the enumeration begins again; this is marked on a clerk's book, *tally* being the diagonal mark; though sometimes each mark is a *tally*, and the fifth or diagonal one is a *tally of tallies*.

able for its fruit, shade, and timber, and for the fragrance of its flowers. It reaches a height of 40 or 50 feet, with a widely spreading crown of dense foliage. The fruit is a flat thickened pod, 3 to 6 inches long, with a brittle brown shell containing a fibrous juicy pleasantly acid pulp inclosing the seeds. It is characterized by flowers with colored caducous bracts, four sepals, three perfect and two rudimentary petals, three perfect monadelphous stamens, and a few staminodes in the form of minute teeth; and by the fruit, a thick indehiscent legume with a fragile crustaceous epicarp, pulpy mesocarp, and thick coriaceous endocarp forming partitions between the seeds. The only species, *T. Indica*, is widely diffused through the tropics, indigenous in Africa and Australia, and naturalized from cultivation in Asia and America. It is a tree bearing abruptly pinnate leaves, with many pairs of small leaflets, and yellow and red flowers in terminal racemes. See *tamarind*.

It is characterized by racemose or spiked flowers with free or slightly coherent petals, and numerous small smooth seeds without albumen, and terminated by a coma of long plumose hairs. Besides the type, *Tamarix*, it includes the genus *Myricaria*, comprising a few similar but smaller European and Asiatic species growing in sand.

**Tamariscineæ** (tam'a-ri-sin'ê-ê), *n. pl.* [NL. (A. N. Desvaux, 1815), < *Tamariscus* + *-ineæ*.] An order of plants, the tamarisk family, of the series *Thalamifloræ* and cohort *Caryophyllinæ*. It is characterized by usually shrubby stems clothed with small undivided alternate leaves, and by flowers with five or more stamens, a one-celled ovary with three to five placentæ, and the sepals and petals free or more or less united. It includes about 45 species, belonging to 5 genera classed in 3 tribes, for the types of which see *Tamarix*, *Reaumuria*, and *Fouquieria*. They are natives of temperate and warmer regions of the northern hemisphere and also of South Africa, occurring mostly in maritime salt-marshes or in sands and gravelly places among mountains. Unlike the related *Caryophyllaceæ*, or pink family, the seeds are either pilose, comose, or winged, which, together with the frequent willowy habit and narrow leaves, has suggested a superficial resemblance to the order *Salicineæ*, the willow family. Many species have also been compared to the cypress, from their appressed scale-like leaves and tall slender stems. They are shrubs, rarely herbs or trees, their leaves commonly somewhat fleshy, and their flowers either small or showy, usually flesh-colored, pink, or white.

**Tamariscus** (tam-a-ris'kus), *n.* [L.] One of the old names for the tamarisk used by botanists and herbalists.

1. A plant of the genus *Tamarix*: sometimes called *flowering cypress*. The common tamarisk is *T. Gallica*, a shrub or small tree of the Mediterranean region and southern Asia. It is a prized ornamental shrub of feathery aspect, with scale-like leaves, and bearing clouds of pink flowers in late summer. It is a highly adaptable plant, thriving in wet, dry, or salty ground, rooting readily from slips and pushing forth vigorously; hence it is suitable for planting on shores and embankments. In the northern United States, however, it dies

to the ground in severe winters. The stem and leaves contain much sulphate of soda. A variety produces Jews' or tamarisk manna. (See *manna*.) *T. articulata* (*T. orientalis*) is the chief source of tamarisk-galls, which are said to contain 50 per cent. of tannin, and are used in dyeing and medicine. It is found in northwest India and westward, and is sometimes distinguished as *tamarix salt-tree*, from its secreting salt which incrusts its trunk in sufficient quantity for some culinary use. It is a bush or tree of coniferous aspect. *T. dioica* of India, etc., yields a pale-yellow soluble resin.

It is distinguished by its free or slightly united stamens, and ovary usually with three or four short styles. About 60 species have been described, now reduced to about 25, natives of the Mediterranean region and central and tropical Asia, chiefly of salt-marshes of the sea-coast; a few occur in South Africa. They are shrubs, sometimes arborescent, bearing minute scale-like clasping or sheathing leaves. It is characterized by small discoid corymbose flower-heads with a naked receptacle, involucral bracts in numerous rows, pappus mostly a ring or crown, and usually two kinds of flowers, the outer row female, slender and tubular, with an oblique or two- or three-toothed apex, and three-angled achenes, the central flowers numerous, perfect, cylindrical, five-toothed, and with five-angled achenes. There are about 20 species, natives of Europe, northern Africa, central and northern Asia, and North America. They are erect annual or perennial herbs, rarely shrubby at the base, commonly strong-scented and hairy or silky. They bear alternate and usually variously dissected leaves, and yellow flowers. A few exceptional species produce larger solitary long-stalked flower-heads. Seven species are native to the western United States, and *T. vulgare* (for which see *tansy*) is naturalized in the Atlantic States and Canada. The flowers are white, and consist of a spreading and somewhat two-lipped border surmounting a tube from 3 to 10 inches long. *T. Jaroba* is the pear-withe of Jamaica.

**tanager** (tan'ā-jēr), *n.* [*< NL. Tanagra*, q. v.] Some or any tanagrine bird; a member of the *Tanagridæ*. Few of these numerous brilliant birds are

actually known as *tanagers* except in technical treatises. Those to which the name is chiefly given are the few species which are conspicuous in the woodlands of the United States. These are the common scarlet tanager, or black-winged redbird, *Piranga rubra*, and the summer redbird, or rose-tanager, *P. aestiva* (also called *cardinal tanager*). Both of these inhabit the eastern parts of the country to New England and Canada. The male of the former is scarlet, with black wings and tail; the male of the latter is rosy-red all over; the females of both are greenish and yellow. In western North America are the Louisiana tanager (so called from much of the region west of the Mississippi was known as Louisiana), *P. ludoviciana*, the male of which is yellow and black, with a crimson head, and the hepatic tanager, *P. hepatica*, a dull liver-red and gray species of the southwest. The foregoing are all 6 or 8 inches long. A tiny and very beautiful tanager, *Euphonia elegantissima*, which is chiefly blue, yellow, and black, comes from Mexico near or over the southern United States border. (See cut under *Tanagridæ*.) Throughout all the woodland of tropical and subtropical America tanagers abound, and represent, with the manikins, cotingas, and tyrant-flycatchers, the leading passerine birds of these regions. See cuts under *Piranga*, *Procnias*, *Saltator*, *Stephanophorus*, *Tanagra*, *Tanagridæ*, *Phainicophilus*, and *cashew-bird*.—**Black-faced tanager**, one of the bullfinch tanagers, *Pitylus grossus*, called by Latham *white-throated grosbeak*.—**Black-headed tanager**, *Lanio atricapillus*, of an orange-yellow color varied with orange-brown, black, and white. It is not a tanager, but a gultuit (*Cerceridae*).—**Scarlet tanager**, *Piranga rubra*, the black-winged redbird of the United States and warmer parts of America. The adult male is scarlet with black wings and tail, 7 inches long and from 11 to 12 inches in extent.

They have nine primaries, scutate tarsi, and more or less conirostral bill, which usually exhibits a slight notch. They are confined to America, and almost entirely to the Neotropical region, only one genus (*Piranga*) having an extensive dispersion in North America. They are small birds, the largest scarcely exceeding a thrush in size, and the average length being about 6 inches. They are remarkable even among tropical birds for the brilliancy and variety of the plumage, in

Lophophanes elegantissima, male

one or both sexes. The *Tanagridæ* are closely related to the finches (*Fringillidæ*), and some of them have the bill as stout as that of a bullfinch; in other cases the bill is slender and acute, approaching that of the American warblers and gnatcatchers (*Mniotiltidæ* and *Corvidæ*). In some instances the bill is strongly notched, and even toothed. The family has never been satisfactorily defined, and is probably insusceptible of exact technical delimitation. It includes several hundred species, of numerous genera. It is divided by Schaler into *Procnatinæ*, *Euphoniinæ*, *Tanagriniæ*, *Lamprotinæ*, *Phoenicophilinæ*, and *Pitiluinæ*. E. tact, tactile, contact, contingent, etc.] I. a. Touching; in geom., touching at a single point: as, a *tangent* line; curves *tangent* to each other. — **Stationary tangent plane of a surface.** See *stationary*. — **Tangent plane,** a plane which touches a curved surface, as a sphere, cylinder, etc.

II. n. 1. In geom.: (a) A straight line through two consecutive points (which see, under *consecutive*) of a curve or surface. If we take the line through any two points of the locus, and then, while one of these points remains fixed, consider the other as brought by a continuous and not infinitely protracted motion along the locus into coincidence with the former, the line in its final position will be a tangent at that point. The idea of time which appears in this definition is only so far essential that some parameter must be used in order to define a tangent at a singular point, and this parameter must be such as to present no discontinuity or point-singularity at that point. A tangent at an ordinary point of a curve or surface may be defined, without the use of any parameter, simply as a line through two points infinitely close together; although, if the doctrine of limits is used to explain away the idea of infinity, a parameter will be used for that purpose. A curve has only one tangent at an ordinary point, or a mere line-singularity, or a cusp, but

Tangent.—The equation of the curve is  $y^2 = (x-x')^2 + 2x'$ . a, ordinary tangent; b, nodal tangent; c, cuspidal tangent; d, inflectional tangent.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents*, pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum*, the lengths and amplitudes of the undulations being duly proportioned. But an intelligence situated on such a curve might see that the tangent had a definite direction, for there is no logical absurdity in this. It is antinomial to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point, and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a spacious curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. III, def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. (b) The length cut off upon the straight line touching a curve between the line of abscissas and the point of tangency.—2. In trigonometry, a function of an angle, being the ratio of the length of one leg of a right triangle to that of the other, the angle opposite the first leg being the angle of which the tangent is considered as the function. Formerly the tangent was regarded as a line dependent upon an arc—namely, as the line tangent to the arc at one extremity, and intercepted by the produced radius which cuts off the arc at the other extremity. Abbreviated *tan*.

3. In the clavichord, one of the thick pins of brass inserted in the back ends of the digitals so that the fingers should press them against the

strings, and produce tones. Its action was not like that of the pianoforte-hammer, since it remained in contact with the string, and fixed the pitch of the tone by the place where it struck. If pressed too hard, it raised the pitch by increasing the string's tension. Accordingly the tone of the clavichord was necessarily weak. — **Artificial tangents.** See *artificial*. — **Chief tangent,** a tangent to a surface which is also a tangent of the intersection of the surface by the tangent plane at the same point of tangency. — **Conjugate, cotriple, double, imaginary, inflectional tangent.** See the adjectives. — **Ideal tangent,** a real line touching a real curve at two imaginary points. — **Inverse method of tangents,** the method of finding the curve belonging to a given tangent. — **Method of tangents.** (a) A method of obtaining the quadrature of a curve by means of an evaluation of the tangent to it, due to Roberval. **tanistry** (tan'is-tri), *n.* [*< tanist + -ry*: see *cry*.]  
A mode of tenure that prevailed among various  
Celtic tribes, according to which the *tanist*, or  
holder of honors and lands, held them only for  
life, and his successor was fixed by election.  
According to this custom the right of succession was not  
in the individual, but in the family to which he belonged—  
that is, succession was hereditary in the family, but elec-  
tive in the individual. The primitive intention seems to  
have been that the inheritance should descend to the  
oldest or the most worthy of the blood and name of the  
deceased. This was in reality giving it to the strongest,  
and the practice often occasioned bloody wars in families.

I have already called it *Tanistry*, the system under which  
the grown men of the tribe elect their own chief, general-  
ly choosing a successor before the ruling chief dies, and  
almost invariably electing his brother or nearest mature  
male relative. *Maine*, Early Law and Custom, p. 145.

Soon after the accession of James I. a decision of the  
King's Bench, which had the force of law, pronounced

been recognised in a great part of the island, to be illegal.

**tannic** (tan'ik), *a.* [*< tan* + *-ic*.] Pertaining to or derived from *tan*.—**Tannic acid**, tannin, a white uncrystallizable inodorous substance,  $C_{14}H_{10}O_8$ , having a most astringent taste, without bitterness. It is very soluble in water, much less so in alcohol. It has an acid reaction, and combines with most salifiable bases. It precipitates starch, albumin, and gluten, and forms with gelatin a very insoluble compound which is the basis of leather, and on which the art of tanning is founded. The word *tannin* has been loosely applied to all astringent vegetable principles. Commercially, tannic acid is of two kinds—*gallo-tannic acid*, derived from nutgalls, and *quercitannic acid*, which occurs in healthy leaves and bark. Gallo-tannic acid is the kind chiefly used. In medicine it is used internally as an astringent and externally as an astringent and styptic. Also called *tannin* and *gallie acid*.—**Tannic acid ointment**. See *ointment*.

**tannier** (tan'i-er), *n.* [Also written *tanner*; origin obscure.] The blue or nut eddoes, *Xanthosoma sagittifolium* (*Caladium sagittifolium*), of the West Indies, cultivated in tropical countries for its farinaceous tuberous root, which resembles that of the eddoes or taro, to which it is allied.

**tannin** (tan'in), *n.* [= F. *tannin*; as *tan* + *-in*.] Same as *tannic acid*. Also called *taya*. See *tannic*.

**tanning** (tan'ing), *n.* [Verbal *n.* of *tan*, *v.*] 1. The art or process of converting hides and skins into leather; the manufacture of leather.

The process is chiefly chemical, and depends essentially upon the action of tannic acid, gallic acid, alum, sulphates of iron and copper, salt, and other agents on the gelatin, gluten, albumin, and other constituents of animal skins. Strictly, tanning is the treatment of hides with tannin, or tannic acid; the treatment of hides with alum and other minerals is called *tawing* (which see). In tanning proper, raw, salted, and dried hides of cattle are treated with some form of tannin, either by itself or in connection with other agents, and the product is called *leather* to distinguish it from the *white* or *alum leather*, *kid*, *lambskin*, etc., produced from the skins of goats, sheep, and other small animals. While a great number of plants yield tannin, the chief source of it is the bark of the oak, hemlock, birch, and beech, and the powdered leaves and young shoots of the sumac. Nutgalls are also used, as they carry gallic acid with the tannic acid. Many other vegetable matters are also used. The treatment of the hides in tanning is essentially a steeping or soaking in baths formed of extracts of tannin either by placing the ground bark directly in the baths, or by employing fluid extracts of the barks or sumacs. The hides are first freed from hair and fleshed, and are then placed in the baths. The art of tanning also includes the mechanical and chemical treatment of the hides to make them supple and water-proof. See *leather*, I.

2. An appearance or hue of a brown color produced on the skin by the action of the sun.

Diseases and distempers incident to our faces are industriously to be cured without any thought or blame of pride: as flushings, redness, inflammations, pimples, freckles, ruggedness, *tanning*, and the like.

**tan-ooze** (tan'üz), *n.* In *tanning*, an aqueous extract of tan-bark, as hemlock- or oak-bark or mixtures of these barks, or of other vegetable substances or mixtures of such substances with one another or with tan-bark, used in tanning. The ooze also usually contains in a suspended state the material or mixture of materials from which the water dissolves out the tannin in making the extract; and, after the more or less prolonged immersion therein of the hides or skins, the latter absorb a large proportion of the extracted tannin, and the ooze becomes somewhat shiny from animal matters. Also called *tan-liquor*.

**tan-pickle** (tan'pik'l), *n.* The liquor of a tan-pit: same as *tan-ooze*.

One of the rare metals occurring in various combinations, but hardly known at all in the separate metallic state. As prepared by Berzelius, but not entirely pure, it appeared as a black powder, which assumed a grayish me-

tallic luster under the burnisher, and which when gently heated took fire, and burned to an oxid. It was discovered by Ekeberg, in 1802, in the mineral afterward named by him *ytrotantalite*, and it has since been found in various rare minerals, as tantalite, columbite, pyrochlore, fergusonite, etc., in which it is almost always associated with niobium. It also occurs in small quantities in various tin, tungsten, and uranium ores. In its chemical relations it is allied to bismuth, antimony, and niobium.

only American representative is *T. loculator*, the wood-ibis of the southern United States and southward. It is known in Arizona and southern California as the *Colorado turkey* (or *water-turkey*), from the Colorado river. (See *wood-ibis*.) The name has been erroneously applied to several different ibises which belong to another family—a misnomer due in part to an old error which identified *T. ibis* with the Egyptian ibis, *Ibis religiosa*.

**Tantalus cup.** A philosophical toy, consisting of a siphon so adapted to a cup that, the short leg being in the cup, the long leg may go down through the bottom of it. The siphon is concealed within the figure of a man, whose chin is on a level with the bend of the siphon. Hence, as soon as the water rises up to the chin of the image it begins to subside, so that the figure is in the position of Tantalus, who in the fable (see *tantalize*) is unable to quench his thirst.

(b) Tapestry now made in the city of Aubusson for wall-hangings and curtains. The greater part of the modern tapestry offered for sale in Paris is attributed to this make. Some of it is of great beauty; but in general old designs are copied, or modified to suit the size of rooms for which the hangings are ordered. — **Bayeux tapestry**, a piece of needlework, 231 feet long and 20 inches wide, preserved in the hôtel de ville of Bayeux in Normandy. It represents the invasion of England by William of Normandy, with the previous incidents leading to the conquest, and is undoubtedly a contemporary work. — **Cluny tapestry**, a strong thick cloth, made of wool and silk, especially for hangings and curtains, of which the manufacture was introduced into England about 1575; the designs are often ecclesiastical in character. — **Gobelins tapestry.** (a) A class of rich French tapestries bearing complicated and often pictorial designs in brilliant and permanent colors, produced at the national establishment of the Gobelins, Paris. (b) By abuse of the name, a printed worsted cloth for covering chairs, sofas, etc., in imitation of tapestry. See *gobelin*. — **Needle-woven tapestry.** See *needle-weave*. — **Neuilly tapestry**, a modern tapestry made on the Jacquard loom, in imitation of that of the Gobelins. — **Russian tapestry.** See *Russian*. — **Savonnerie tapestries**, Savonnerie carpets, the production of the ancient factory of La Savonnerie, established at Paris under the reign of Henry IV., and afterward united with the Gobelins factory. — **Tapestry Brussels carpet**, Brussels carpet woven with a common loom and printed in the warp. — **Tapestry carpet**, a kind of twoply carpet of which the warp or weft is printed before weaving so as to form a figure in the fabric. It has a long warp, is often dyed of many colors and embellished with threads of gold or silver, and is used for hangings as a substitute for real tapestry. — **Tapestry velvet** or **patent velvet carpet**, tapestry Brussels cut like Wilton. — **Tapestry weaver**, one of certain rectilinear spiders of the group *Tubulera*.

**tape-work** (tāp'wērk), *n.* A kind of ornamental work consisting of knots, rosettes, etc., made of tape, and connected together by braid or cord, arranged in varied patterns and sewed strongly into a continuous texture, or else worked with the crochet-needle to form a background to the figures made by the tape.

**tapeworm** (tāp'wērm), *n.* An entozoic parasitic worm, of flattened or tape-like form and indeterminate length, consisting of many separable joints, found in the adult state in the alimentary canal of most vertebrate animals.

Such worms belong to the order *Cestodea* or *Teniatoda*, family *Teniatidae*, and several different genera, especially *Tenia*, the true tapeworms, and *Bothriocephalus*, the broad tapes. The so-called "head" of a tapeworm, small and inconspicuous in comparison with the great length to which the body may attain, is the whole of the real worm, all the rest of the joints being merely successive generative buds, which contain the matured sexual elements, and are technically called *proglottides*. They are continually budded off from the head, the oldest joint being the one furthest from the head; and any number of them may be broken off and expelled from the body without stopping their continual gemination. This is why no tapeworm can be eradicated unless the head is expelled from the host. The chain of links or joints is the strobila; it may consist of several hundred generative buds, and grow to be several yards long. These formidable parasites are parenchymatous, having no mouth nor alimentary canal, and live by absorbing nourishment from that intended to nourish the host, so that persons thus parasitized may suffer from defective nutrition while acquiring a ravenous appetite. The head of the tape is provided with hooks or suckers, or both, for adhering to the mucous membrane of the host. The ova, matured in every one of the joints, do not complete their development in the animal in which the adult exists. They require to be swallowed by some other vertebrate, the ripe proglottides being expelled from the bowel of the host with all their contained ova fertilized. The segments or proglottides decompose and liberate the ova, which are covered with a capsule. After being swallowed the capsule bursts, and an embryo, called a *procoelax*, is liberated. This embryo, by means of spines, perforates the tissues of some contiguous organ, or of a blood-vessel. In the latter case being carried by the blood to some solid part of the body, as the liver or brain, where it surrounds itself with a cyst, and develops a vesicle containing a fluid. It is now called a *scolex* or *hydatid*, and was formerly known as the *cystic worm*. The scolex is incapable of further development till swallowed and received a second time into the alimentary canal of a vertebrate. Here it becomes the head of the true tapeworm (see *tenia-head*), from which proglottides are developed posteriorly by gemination, and the adult animal with which the cycle began is thus reached. (See cut under *tenia*.) At least eight tapeworms, mostly of the genus *Tenia*, are found in man. The pork tape is *T. solium*, which in its cystic form (the so-called *Cysticercus cellulosus*) in the pig produces the disease *measles* (see *measles*, 2); it is acquired by those who eat

Broad Tapeworm (*Bothriocephalus latum*), in several sections, with intervening joints omitted. 1, head; 2, other end; 3, several segments enlarged; 4, head, enlarged.

The Egyptian or dwarf tape is *T. nana*; others are the elliptic-jointed, *T. elliptica*; the crested, *T. lophocoma*; the spotted, *T. flavopuncta*. A dog-tape is *T. serrata*; its larva, called *Cysticercus pisiformis*, is the pea-measle of the rabbit. Another dog-tape is *T. caninus*, whose larva is the cystic worm (*Caninus cerebralis*) of the sheep's brain, producing the gid or staggers. A third dog-tape is *T. echinococcus*, whose larva, known as *Echinococcus veterinorum*, is a common hydatid sometimes found in man. *T. marginata* of the dog is the tapeworm from the slender hydatid *Cysticercus tenuicollis* of the sheep. A cysticercus of the mouse becomes *Tania crassicolis* in the cat. Certain cysticerci of moles become in the fox *Tania tenuicollis* and *T. crassiceps*. The broad tapeworm of man is *Bothriocephalus latus*, also called *Swiss tapeworm*, and another human parasite of this genus is *B. cordatus*. Tapes are also called *ribbon-worms*. In the puddling-furnace, a small hole through which the slag, technically termed *tap-cinder*, is let out, and which during the process of puddling is stopped with sand. See diagram under *puddling-furnace*. (c) In a cementation-furnace, a small hole in one end of each pot, opposite to which is a hole in the furnace-wall, used for the insertion of "trial" or "tap" bars, so placed as to be accessible for ready withdrawal and inspection during the cementation process. Also called *testing-hole*. (d) In general, any small hole in a furnace through which metal or slag, or both, are drawn at any stage in the process. Also *tapping-hole*.

A conical cavity is dug in the side of a bank or a steep hill, and a cast-iron pan is placed at the bottom, from which leads a spout into a barrel for collecting the tar. Billets of wood (such as pine or fir) are thrown into this cavity, and, being covered with turf, are slowly burned without flame. The wood chiefly used in Europe is that of the Scotch pine, *Pinus sylvestris*, and the Siberian larch, *Larix Sibirica*. In the United States that of the long-leaved pine, *Pinus palustris*. Most of the tar produced in the United States is made in North Carolina, Virginia, and Georgia. In England wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinager (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters, of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, etc., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in the process of gas-manufacture. It is a very valuable substance, the compounds obtained from it forming the basis of many chemical manufactures. See *coal-tar*.

It classified all articles under eight schedules, and greatly reduced the duties from the tariff of 1842. Its rates were still further reduced by the act of 1857.—Wilson tariff (from William L. Wilson, chairman of the Ways and Means Committee), the tariff established by the act of 1894. It made the average rate of duties somewhat lower than that which resulted from the McKinley tariff. Dryden, Abs. and Achit., I. 249.

**tarnish** (tär'nish), *n.* [< *tarnish*, *v.*] 1. A spot; a blot; the condition of being dulled or stained.—2. In *mineral*, the change in luster or color of the surface of a mineral, particularly one of

metallic luster: usually due to slight alteration, but also in some cases to the deposition of a very thin film of some foreign substance. Thus, a freshly fractured surface of bornite soon gains a tarnish on exposure, becoming a bright purple color; it is hence often called *variegated* or *purple copper ore*; so also columbite crystals often show a brilliant steel-blue tarnish.

### 3. A coating. [Rare.]

**taro**<sup>1</sup> (tä'rō), *n.* [Also *tara*; *< Polynesian taro.*] A food-plant, *Colocasia antiquorum*, especially the variety *esculenta*, a native of India, but widely cultivated in the warmer parts of the globe, particularly in the Pacific islands. It is a stemless plant with the general habit of the caladiums of house and garden culture. The leaves are heart-shaped and about a foot long. Its chief value lies in its stem-like tuberous starchy root, which is eaten boiled or baked, made into a bread or pudding, or in the Sandwich Islands, where it is the staple food of the natives, in the form of poi (which see). The tubers, when baked, pounded, and pressed, keep fresh many months. An excellent starch can be had from them. The leaves and leafstalks are also edible, with the character of spinach or asparagus. All parts of the plant are acrid, but this quality is removed by cooking. Taro is propagated by a cutting from the top of the tuber, which, in the Fiji Islands at least, is planted as soon as the crop is gathered. About fifteen months are required to mature the root. See *Colocasia* (with cut), also *cocco*, *eddoes*, and *tanya*.

We had ample opportunity to observe the native ways of living, . . . an uninteresting mess of stewed fowl and taro.  
*Lady Brassey, Voyage of Sunbeam*, II. xv.

**tarot** (tar'ot), *n.* [Also *taroc* (= *G. tarock*) (*< It.*); *< F. tarots*, *< It. tarocchi*, a kind of checkered cards, also the game called tarot; origin obscure.] 1. One of a pack of playing-cards first used in Italy in the fourteenth century, and so named from the design of plain or dotted lines crossing diagonally on the back of the cards. The original pack contained seventy-eight cards—namely, four suits of ten numeral cards, as in the modern game, with four coat-cards (king, queen, chevalier, and valet) in each suit, and a series of twenty-two attuti or atouts, these last being the trumps, and known specifically as the *tarots*.

**tarpan** (tär'pan), *n.* [Tatar name.] The wild horse of Tatar, belonging to one of those races which are by some authorities regarded as original, and not descended from domestic animals. Tarpans are not larger than an ordinary mule, are migratory, and have a tolerably acute sense of smell. Their color is invariably tan or mouse, with black mane and tail. During the cold season their hair is long and soft, lying so close as to feel like a bear's fur, and then it is grizzled; in summer it falls much away, leaving only a quantity on the back and loins. They are sometimes captured by the Tatars, but are reduced to subjection with great difficulty.

**tarpaulin** (tär-pä'lin), *n.* [Formerly also *tarpawlin*; a reduction in sailors' speech of *tarpauling*, *tarpawling*, prop. \**tarpalling*, *< tar*<sup>1</sup> + *palling*, *pawling*, a covering, verbal *n.* of *pall*<sup>1</sup>, *v.* Hence, by abbreviation, *tar*<sup>3</sup>.] 1. Tarpeianus*, usually *Tarpeius*, pertaining to Tarpeius or Tarpeia (*Tarpeius Mons* or *Tarpeia Rupes*, the Tarpeian Rock), *< Tarpeius*, *Tarpeia*, a Roman family name.] Noting a rock on the Capitoline Hill at Rome over which persons convicted of treason to the state were hurled. It was so named, according to tradition, from *Tarpeia*, daughter of the governor of a citadel at Rome, who betrayed the fortress to the Sabine soldiers, and was crushed to death under their shields and buried at the base of the rock.

Bear him to the rock *Tarpeian*, and from thence  
Into destruction cast him.

**tarpon** (tär'pon), *n.* [Also *tarpum*; origin not ascertained.] A large game-fish of the family *Elopidae* and subfamily *Megalopinae* (which see), specifically *Megalops atlanticus*, also called *jew-fish*. This is one of the so-called big-eyed herrings, and a near relative of *Elops saurus*; but the pseudobranchiae are obsolete, the dorsal fin has a long filament, and the

scales are very large. The form is elongate and compressed; the color is brilliant-silvery, darker on the back; and the length attained is about 6 feet. This fish is common in the warmer waters of the Atlantic, as on the southern coast of the United States, where it is sometimes called *grande écaille*, from the size of the scales, which are used in ornamental fancy work. Its technical synonym, *M. thynnoides*, is erroneous, being based on *Clupea thynnoides* of Bloch and Schneider, 1801, and that on Broussonet's *Clupea cyprinoides*, which is the East Indian representative of this genus (*Megalops cyprinoides*), a distinct though very similar species to which the name *tarpon* or *tarpum* is extended by Jordan.

Same as *palpebral ligament* (which see, under *palpebra*).—**Tarsal ossicle**, *sinus*, etc. See the nouns.—**Tarsal system**, a system of classification, proposed by Olivier and adopted by Latreille and other eminent entomologists, by which all coleopterous insects were arranged in sections in conformity to the real or supposed number of joints in their tarsi. These sections, as proposed by Olivier, were (1) *Pentamera*, having five joints to all the tarsi; (2) *Heteromera*, having the four anterior tarsi five-jointed and the two posterior four-jointed; (3) *Tetramera*, having four joints to all the tarsi; (4) *Trimeria*, having three joints to all the tarsi. To these Latreille added (5) *Dimeria*, having two joints to all the tarsi, and (6) *Monomera*, having but a single tarsal joint in each foot. Some of these divisions are now known to have rested on imperfect observations, and all are subject to exceptions among closely allied species, hence the tarsal system has been generally abandoned or modified, though in many respects it approached a natural classification, and, admitting the exceptions, the divisions can still be used with advantage. Its convenience is such that attempts have also been made to retain it, in its general features, with substitution of other names intended to correct the early imperfect observations, as *Cryptopentamera*, *Pseudotetramera*, *Subpentamera*, etc., and the adjectives derived from all these terms, as *pentamerous*, *heteromericous*, etc., are regularly used in describing beetles and their tarsi.

The tarsus is thus about as long as all the rest of the foot, and much longer than the metatarsus. The condition of the parts is unique among mammals though approached in some of the galagos (of the genus *Otilopus*). The tarsier is a small nocturnal lemur of slender form with long hind legs, very long slender tail tufted at the end, fingers and toes padded at the ends like a tree frog's, and very large eyes. rami are straight and slender without coronoid process or the inflected angle very characteristic of marsupials; and the tail is very long, slender, and prehensile. The only species, *T. rostratus*, is of the size and somewhat the appearance of a mouse, and inhabits western Australia, living in trees and bushes, and feeding on insects and wild honey.

**tarsus.**] The single compound bone of some animals, especially birds, resulting from the combination of tarsal and metatarsal bones in one. This formation occurs in all birds and probably some reptiles. In the former the three principal metatarsal bones fuse into one, the fourth metatarsal remaining distinct or only incompletely joined to the rest; and to the proximal extremity of the compound metatarsal thus formed are also ankylosed the elements of the distal tarsal series. The result is similar to that seen in the compound cannon-bone of hoofed quadrupeds, though this has no tarsal elements. The tarsometatarsus is a comparatively large stout bone, extending from the heel or sufragio to the bases of the toes. It corresponds to that part of the foot commonly called the *tarsus* in descriptive ornithology, and is usually naked and scaly, though sometimes feathered. Its proximal extremity usually presents a large bony protuberance (the so-called calcaneum or hypotarsus), perforated for the tendons of certain muscles, and the distal extremity is divided into three prongs (two in the ostrich), each bearing an articular surface for one of three toes (the first toe, or hallux, when present, being differently attached to the foot by an accessory metatarsal). The bone is nearly always compressed, or of less width than depth; but in the penguins it is broad from side to side and shows two fontanelles, or vacant spaces, indicating its triple composition. It is often called simply *metatarsus*, its tarsal elements being ignored. See also cut under *metatarsus*.

**tarsotarsal** (tär-sō-tär'sal), *a.* [**< tarsus + tarsus + -al.**] Mediotarsal, as the ankle-joint of birds and reptiles, which is situated between the two rows of tarsal bones, and not between the tibia and the tarsus as in mammals.

**tarsotibial** (tär-sō-tib'i-al), *a.* [**< tarsus + tibia + -al.**] Same as *tibiotarsal*.

[= *F. tarse*, < *NL. tarsus*, < *Gr. τάρσις*, any broad flat surface, as for warming or drying things upon (*τάρσις ποδός*, the flat of the foot), < *τέπεισθαι*, dry, dry up: see *terra*, *thirst*.] **1.** In *zool.* and *anat.*, the proximal segment of the pes or foot, corresponding to the carpus of the manus or hand; the collection of bones between the tibia and the metatarsus, entering into the construction of the ankle-joint, and into that part of the foot known in man as the instep. It consists in man of seven bones: the astragalus or hucklebone, alone supporting the leg; the calcaneum, os calcis, or heel-bone; the scaphoid or navicular bone; the cuboid, supporting the two outer metatarsals; and three cuneiform bones, supporting the other three metatarsals. The tarsal bones tend to arrange themselves in two rows, called the *proximal* and *distal* rows: in man the first three just named belong to the proximal row. A generalized tarsus, as found in some reptiles, consists of nine tarsal bones: an outer proximal, the fibulare; an inner proximal, the tibiale; one between these, the intermedium; a central one, the centrale; with five in a distal row, one for each metatarsal, called *tarsalia*, and distinguished as *tarsale I-V* from inner to outer side. Various suppressions, confluences with one another or with other bones, or additions to the number occur, destroying the symmetry of the typical tarsus; but seven is the normal mammalian number, as in man, where the astragalus is supposed to = the tibiale; intermedium; the calcaneum = fibulare; the scaphoid = centrale; the cuboid = tarsalis IV + V; the three cuneiforms = tarsalia I, II, III. In all *Mammalia* the ankle-joint is between the tarsus and the tibia, or tibiotarsal; in all vertebrates below *Mammalia* which have a tarsus the ankle-joint is among the tarsal bones, between the proximal and distal rows, and therefore mediotarsal. Birds offer the most exceptional case, there being apparently no tarsus, or tarsal bones, in the adult. This appa-

Right Tarsus of an Amphibian (*Salamandra*), showing nearly symmetrical disposition of the tarsal bones. *T*, tibia; *F*, fibula; *i*, tibiale; *f*, fibulare; *int*, intermedium; *c*, centrale; these are tarsal bones of the proximal series; 1-5, the five tarsalia, or distal tarsals, known as tarsale 1, tarsale 2, etc.; 1-V, the corresponding five digits or phalanges.

rent anomaly is explained by the fact that the embryo has several tarsal elements, proximal ones of which become consolidated with the tibia as the condyles of the latter, and distal ones of which become similarly fused with the principal metatarsal bone. Hence, a bird's tibia is really a tibiotarsus, and a bird's principal metatarsal bone is really a tarsometatarsus; and the ankle-joint, apparently between the tibia and the metatarsus, is really mediotarsal, as is usual below mammals. See cuts under *booted*, *Catarrhina*, *digitigrade*, *Equidae*, *foot*, *metatarsus*, *Plantigrada*, and *Plesiosaurus*.

Hence—2. In *descriptive ornith.*, the shank; the part of the leg (properly of the foot) of a bird which extends from the bases of the toes to the first joint above, the principal bone of this section consisting of three metatarsal bones fused together and with distal tarsal bones. See cuts under *booted*, *scutellate*, and *tarsometatarsus*.—3. In *entom.*: (a) The foot; the terminal segment of any leg, next to and beyond the tibia, consisting of a variable number of joints, usually five, and ending sometimes in a pair of claws like pincers, or in a sucker-like pad, or otherwise. It normally consists of five joints, but some of these may be very small or entirely aborted, and in a few insects there is only one joint. These modifications are much used in classification, especially of beetles. (See *tarsal system*, under *tarsal*.) The joints are distinguished by numbers, the first being that attached to the tibia (in bees sometimes called the *plantula* or *palma*, and in flies the *metatarsus*). The last joint is generally terminated by two hooks or claws called *ungues*, with a little piece, the onychium, between them which Huxley regards as a sixth joint. (See *unguis*.) The tarsi serve the same purposes as the feet of vertebrate animals. See cuts under *coxa*, *Erochulus*, *mole cricket*, *Pentameria*, and *Tetramera*. (b) The last joint of a spider's leg, forming, with the preceding joint, or metatarsus, the foot.—4. The reason given by Paracelsus, "because it produces oil, water, tincture, and salt, which burn the patient as *Tartarus* does," is evidently imagined; but the word was no doubt connected with *L. Tartarus* in some vague way. It is said to be of Ar. origin, but it could not come, except by very unusual corruption, from the Ar. word given as its source, viz. Ar. (and Pers.) *dard*, dregs, sediment, the tartar of wine, the mother of oil; cf. Ar. *durdi*, Pers. *dardi*, dregs, sediment; Ar. *darad*, a shedding of the teeth, *darda*, a toothless woman—referring, according to Devic, to the tartar on teeth.] 1. Of, pertaining to, or obtained from tartar.—**Tartaric acid**, C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>, the acid of tartar. This acid has four modifications, all having the same chemical composition, but characterized chiefly by their differences of action upon a ray of polarized light—common or dextrorotatory, levorotatory, racemic or paratartaric, and optically inactive or mesotartaric acid. The first-named is the commercial article. It crystallizes in large rhombic prisms, transparent and colorless, and very soluble in water. It is inodorous, and very sour to the taste. Tartaric acid is dibasic; its salts are called *tartrates*, and have a most remarkable disposition to form double salts, such as Rochelle salts, double potassium sodium tartrate, tartar emetic, double potassium antimony tartrate, etc. Tartaric acid is found in the free state in grape-juice, tamarinds, and many fruits, but chiefly in the form of acid potassium tartrate. It is obtained commercially from this salt, called *argol*, which deposits in crusts from fermenting wines. The purified salt is called *cream of tartar*. Tartaric acid is largely used in dyeing and calico-printing, and also in medicine.

= Syn. 3. *Taste, Savor, Flavor, Smell.* *Taste* is the general word, so far as the sense of taste is concerned, as the *taste* of an apple may be good, bad, strong, woody, earthy, etc. *Savor* and *flavor* may apply to the sense of *taste* or to that of smell. *Savor* in *taste* generally applies to food, but is otherwise rather indefinite, as, to detect a *savor* of garlic in soup. *Flavor* is generally good, but sometimes bad. It is often the predominating natural *taste*, as, the *flavor* of an apple is more marked or more palatable than that of another. *Smell* is a slight *taste*, or, figuratively, a faint smell, generally the result of something not disagreeable added to the thing which is tasted or smelled, as, a *smell* of vanilla in ice-cream, a *smell* of salt in the sea breeze. 6. *Taste, Sensibility.* *Taste* is active, deciding, choosing, changing, arranging, etc.; *sensibility* is passive, the power to feel, susceptibility of impression, as from the beautiful — 7. *Taste, Judgment.* As compared with *judgment*, *taste* always implies a subtle sensibility, a sense of the beautiful, and a power of choosing, arranging, etc., in accordance with its laws. *Judgment* is purely intellectual. E. also *taunte*, *taunte*, also (and still dial.) *tant*; according to Skeat, prob. < OF. *tanter*, var. of *tenter*, *tempter*, try, tempt, provoke (> ME. *tenten*, *tempten*, E. *tempt*), < L. *tentare*, try, tempt; see *tempt<sup>2</sup>*, *tempt*, of which *taunt* is thus a differentiated form. Skeat also quotes a passage from Udall, tr. of "Erasmus's Apophthegms," Diogenes, § 68, "Geuyng vnto the same *taunt pour taunte*, or one for another," suggesting an origin in the F. phrase *taunt pour tant*, 'so much for so much'; see *tantity*. There is no evidence that the sense was affected by OF. *tauser*, *taucer*, *tenser*, F. *taucer*, cheek, scold, reprove, taunt, < ML. as if \**tentare*, from the same source as *tentare*.] 1. Originally, to tease; rally; later, to tease spitefully; reproach or upbraid with severe or insulting words, or by casting something in one's teeth; twit scornfully or insultingly.

Sometime taunting woutte displease, not woutt disport.

*Heywood, Hierarchy of Angels*, p. 10.

=**Syn.** 1. *Ridicule*, *Chaff*, *Deride*, *Mock*, *Upbraid*, *Taunt*, *Flout*, *Teit*. We may *ridicule* or *chaff* from mere sportive-ness; we may *ridicule* or *upbraid* with a reformatory purpose; the other words represent, and all may represent, an act that is unkind. All except *mock* imply the use of words. As to *ridicule*, see *ludicrous* and *baiter*, *v.* and *n.* *Chaff*, which is still somewhat colloquial, means to make fun of or tease, kindly or unkindly, by light, ironical, or satirical remarks or questions. *Deride* expresses a hard and contemptuous feeling. *Derision* is ill-humored and scornful; it is anger wearing the mask of *ridicule*. (*C. J. Smith, Syn. Disc.*, p. 65). It is not always so severe as this quotation makes it. *Mock*, in its strongest sense expresses the next degree beyond *derision*, but with less pretense of mirth (see *initiate*). We *upbraid* a person in the hope of making him feel his guilt and mend his ways, or for the relief that our feelings find in expression; the word is one degree weaker than *taunt*. To *taunt* is to press upon a person certain facts or accusations of a reproachful character unsparingly, for the purpose of annoying or shaming, and glorying in the effect of the insulting words; as, to *taunt* one with his failure. To *flout*, or *flout at*, is to *mock* or *insult* with energy or abruptness. *Flout* is the strongest of these words. To *twit* is to *taunt* over small matters, or in a small way. *Twit* bears the relation of a diminutive to *taunt*.

**taunt<sup>1</sup>** (tānt or tānt), *n.* [Also dial. *tant*. < *taunt<sup>1</sup>*, *v.*] 1. Upbraiding words; bitter or sarcastic reproach; insulting invective.

tax (taks), *n.* [*< ME. tax, taxen, < OF. (and F.) taxe = Pr. taxa = OSp. tassa, Sp. tasa = Pg. taxa = It. tassa, < ML. taxa, also tasca, a taxation, tax, < L. taxare, touch, rate, appraise, estimate: see tax, v. Cf. taw<sup>1</sup>, n.*] 1. A disagreeable or burdensome duty or charge; an exaction; a requisition; an oppressive demand; strain; burden; task.—2. An enforced proportional contribution levied on persons, property, or income, either (a) by the authority of the state for the support of the government, and for all its public or governmental needs, or (b) by local authority, for general municipal purposes. In a more general sense the word includes assessments on specific properties benefited by a local improvement, for the purpose of paying expenses of that improvement. Taxes, in the stricter sense, are direct when demanded from the very persons who it is supposed as a general thing will bear their burden: as, for example, poll-taxes, land or property taxes, income taxes, taxes for keeping man-servants, carriages, or dogs. Taxes are said to be indirect when they are demanded from persons who it is supposed as a general thing will indemnify themselves at the expense of others—that is, when they are levied on commodities before they reach the consumer, and are paid by those upon whom they ultimately fall, not as taxes, but as part of the market price of the commodity (*Cowley*): as, for example, the taxes called *customs*, which are imposed on certain classes of imported goods, and those called *excise duties*, which are imposed on certain home manufactures and articles of inland production. In the United States all state and municipal taxes are direct, and are levied upon the assessed values of real and personal property, while the revenue required for general governmental purposes is derived from indirect taxes upon certain imports, and upon whisky, tobacco, etc. In the United Kingdom the governmental revenues are derived from both direct and indirect sources—from taxes on persons, stamps, dogs, etc., from imposts on a few imported articles of consumption, especially tea, spirits, tobacco, and wines, and from excise duties. House taxes, or taxes on rental, form the largest part of the local rev-

enues, municipal revenues being entirely raised from this source. See phrases below.

Since (bounteous Prince) on me and my Descent  
Thou dost impose no other tax nor Rent  
But one sole Precept, of most just condition  
(No Precept neither, but a Prohibition).

Sylester, tr. of Du Bartas's Weeks, II, Eden.

See *inheritance*. — **Poll tax**. See *poll-tax*. — **Single tax**, in economics, taxation solely on land-value, to the exclusion of other taxation by the same state. According to the theory advocated in recent times by Henry George and others, this tax should supersede all others, and should fall only on valuable land, exclusive of the improvements on such land.

The *single tax*, in short, would call upon men to contribute to the public revenues not in proportion to what they produce or accumulate but in proportion to the value of the natural opportunities they hold. It would compel them to pay just as much for holding land idle as for putting it to its fullest use.

Henry George, Single Tax Platform.

A kind of tax which the states are prohibited by the United States Constitution from imposing, as distinguished from pilotage, quarantine, and similar dues imposed with reference to a service rendered or tendered. **Wheel tax**, a popular name for a tax upon carriages. **Window tax**. See *window*. — **Syn.** 2. *Tax, impost, duty, custom, toll, rate, levy, assessment, tribute*. **Tax** is the general word for an amount demanded by government for its own purposes from those who are under its authority. *Impôts de duties, and customs* are levied upon imports or exports but *impost* applies to any tax viewed as laid on. *Toll* and *rate* are certain kinds of taxes, as toll at a bridge, ferry or plank road, church rate and poor rate in England, water rate. *Levy* is a precise word in England but differs in most frequent use in connection with malt and spirituous liquors. *Assessment* is either (a) the valuation of property for the purpose of its taxation, (b) the imposing of the tax; or (c) a charge on immovable property of a share of the expense of a local improvement specially benefiting that property. *Tribute* views the tax as laid not for the public good, but arbitrarily for the benefit of the one levying it, especially a conqueror, as, "Millions for defense, but not one cent for tribute." (Waterhouse, 1838), < NL. *taxus*, a budger, + Gr. *idea*, form.] A genus of *Musculidae*, of the subfamily *Melina*, which contains the American budger, *T. americana*. It differs from *Melos* and other meline genera in many important cranial and dental characters, as well as in external form. The teeth are 31, with only 1 true molar above and 2 below on each side. The form is very stout, squat, and clumsy; the tail is short and broad; the

pelage is loose, with diffuse coloration; the fore claws are very large, and the habits thoroughly fossorial; the hind feet are plantigrade; the perianth glands are moderately developed, and there is a peculiar subcaudal pouch, as in other badgers. A second species or variety, *T. berlandieri*, inhabits Texas and Mexico. See *badger*.

**Taxodiæ** (tak-sô-di'ô-ê), *n. pl.* [NL. (Parlatore, 1864), *< Taxodium + -æ*.] The name used by De Candolle for a tribe of conifers, nearly the same as the subtribe now known as *Taxodineæ*. Bentham and Hooker (1850), retaining the name *Taxodiæ*, altered the tribe by excluding the genera *Cunninghamia* and *Sciadopitys* and by including *Cephalotaxus*; and in this form the tribe coincides with the *Taxodineæ* of Goebel (1852), except that the latter excludes *Cephalotaxus*.

**Taxodineæ** (tak-sô-di'ô-ê), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxodium + -ineæ*.] A subtribe of conifers, classed under the tribe *Abietineæ*, and including 12 species, belonging to 7 genera, differing widely both in characters and in locality, some of them among the most remarkable of all known trees. Several inhabit Japan or China or both, as *Glupostrobus*, including two small species, and *Sciadopitys*, *Cunninghamia*, and *Cryptomeria*, all monotypic genera of lofty trees. A second group, of three species of small or middle-sized trees, the genus *Athrotaxis*, occurs in Tasmania and Victoria. The remaining or North American group consists of the two genera *Taxodium* and *Sequoia*, each of two species, all attaining either an immense height or girth or both. See *Taxodium* (the type), also *Sequoia*, *Sciadopitys*, and *Cunninghamia*. Compare *Taxodiæ*.

**Taxodium** (tak-sô-di'um), *n.* [NL. (L. C. Richard, 1810), *< Gr. taxis*, yew, + *idom*, form.] A genus of coniferous trees, of the tribe *Abietineæ*, type of the subtribe *Taxodineæ*. It is characterized by a globose or obovoid cone composed of scales with an entire margin, at the apex woody, dilated, and truncate, on the back umbonate or mucronate, and including the two irregularly three-angled seeds, which contain six to nine cotyledons. There are two species, natives of the United States and Mexico. They are loosely branched trees, bearing alternate, somewhat spirally set leaves, linear and spreading in two ranks, or small, appressed, and scale-like on the flower-bearing branches. The slender leaf-bearing branches resemble pinnate leaves, and fall off in autumn like the leaves of the larch. The flowers are monocious, both sexes on the same branches, the staminate forming drooping spiked panicles, while the female form sessile globose aments scattered singly or in pairs, and

*Taxodium distichum.*

closely crowded with spirally set scales. The fruit is a hard round cone, an inch long, with its very thick angular peltate stalked scales gaping apart at maturity, but persistent after the fall of the seeds, which are large, shining, and coriaceous or corky on the surface. *T. distichum*, the bald or red cypress of the United States, is characteristic of southern swamps near the sea-coast, occupying large tracts to the exclusion of other trees, and extending often into deep water around lake-margins. It occurs from Delaware to Texas, and also in the Mississippi and Ohio valleys to Indiana and Illinois. It often reaches a great size, sometimes 150 feet in height and 36 in girth, and furnishes a valuable wood which is soft, close, easily worked or split, and very durable, and is much employed for cooperage, railway-ties, fences, posts, and shingles. It is almost indestructible in water or in contact with earth, but is often injured, especially beyond the Mississippi, by a fungus, a species of *Dactyla*. Two varieties are distinguished by lumbermen—the *white cypress*, with light-brown wood, and the *black cypress*, with dark-brown harder and more durable wood, at first heavier than water, the sap-wood of both is nearly white. The tree is also the source of an essential oil, a superior turpentine, and a medicinal resin, and from the beauty of its feathery foliage it is valued for lawn cultivation. It is especially remarkable for its habit, when growing under water, of throwing up large smooth conical projections known as *cypress-knees*, commonly 2 (sometimes 7) feet high, covered with reddish bark like the roots, and hollow, as is the base of the tree itself. They are by some supposed to be aerating organs, by others to serve as braces to afford a stable lateral support in the yielding bottom, and by others to be undeveloped or arrested tree-trunks. (Compare *cypress-knee*, *knee*, 3(d), and *cypress*.) The tree itself often rises out of water as a straight gray shaft 80 or 90 feet high before dividing into its flat spreading top, its base ribbed by large projecting buttresses, each continuous below with a strong and branching root, from horizontal branches of which the knees arise. The tree is also remarkable for its great longevity, growing rapidly at first, but soon becoming as slow-growing as the yew, and adding only an inch in twelve to thirty years. The other species, *T. mucronatum*, the Mexican cypress, or ahuchete, forms extensive forests in the Sierra Madre, at elevations from 4,000 to 9,000 feet, itself often reaching 70 to 100 feet high, with longer and pendulous branchlets and more persistent greener leaves. It attains even a greater size and age than *T. distichum*; the celebrated *cypress of Montezuma*, in the gardens of Chapultepec, variously estimated from 700 to 2,000 years old, is 41 to 45 feet in girth and about 120 feet high; one at Atlitico is about 76 feet, and another, near Oaxaca, 112 feet in girth; the latter was estimated by A. de Candolle and Asa Gray to be at least 1,000 years old. A third species, *T. heterophyllum* (for which see *yew-pine*, under *pine*), is now separated as *Glupostrobus heterophyllum*, on account of its obovoid cone and stalked seeds. The genus is of great antiquity geologically being found in the Cretaceous and in great abundance in the Tertiary of nearly all parts of the world.

**Taxoidæ** (tak-sô-di'ô-ê), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxus + Gr. idos*, form, + *-æ*.] 1. A tribe of conifers, of the suborder *Taxaceæ* (the suborder *Taxoidæ* of Eichler), distinguished from *Taxææ*, the other tribe within that suborder, by the absence of any bracteoles around the ovules. It includes about 51 species, of 1 genera, two of which are monotypic, *Saxægothra*, a small yew-like tree of Patagonia, and *Microcachrys*, a prostrate shrub of Tasmania. For the others, see *Podocarpus* and *Dacrydium*. The tribe as now received coincides with the *Podocarpaceæ* of previous authors with the addition of *Dacrydium*. 2. Eichler's second suborder of conifers, the same as the *Taxaceæ*, and including Eichler's tribes *Taxoidæ* and *Taxææ*.

Our knowledge of the anatomy, and especially of the development, of the Invertebrata is increasing with such prodigious rapidity that the views of *Taxonomists* in regard to the proper manner of expressing that knowledge by classification are undergoing, and for some time to come are likely to undergo, incessant modifications. *Huxley, Anat. Invert.*, p. 561.

**Taxus** (tak'sus), *n.* [NL. (Tournefort, 1700), *< L. taxus = Gr. taxis*, a yew-tree.] A genus of conifers, the yews, type of the tribe *Taxææ* and suborder *Taxaceæ*. It is characterized by mostly dioecious flowers, the female solitary and consisting of a single erect ovule on a small annular disk, which soon becomes cup-shaped and fleshy, and finally forms a pulpy berry inclosing the seed, but free from it and open at the truncate apex. The small globose male flowers are solitary in the axils, surrounded by a few imbricated scales, with a short stalked stamen-column, five to eight roundish depressed and furrowed anthers, which become almost umbrella-shaped and four- to six-lobed after maturity, and bear three to eight cells connate into a ring. The ripened seed is hard, woody, and nut-like, somewhat viscous when fresh, and contains an embryo of two cotyledons. There are 6 or 8 species, by some considered all varieties of one, natives all of the northern hemisphere and widely dispersed. They are evergreen trees or shrubs, bearing short-petioled flat linear rigid leaves which are somewhat spirally inserted, but usually spread falcately into ranks. The genus is remarkable for the great variation within the same species, *T. baccata*, the yew, seldom exceeding 15 or 20 feet in height in England, but in the Himalayas becoming a naked trunk 30 feet high and often 16 in girth, its top reaching 70 or, it is said, sometimes 100 feet in height. *T. brevifolia* is similarly a low shrub in Montana, but a stately tree sometimes 75 feet high near the Pacific. *T. canadensis*, the ground-hemlock, formerly regarded as a variety of the British species, usually a prostrate shrub, extends from New Jersey and Iowa northward, generally under evergreens. The other North American species, *T. floridana* of West Florida and *T. globosa* of Mexico, are small trees, as are those of Japan, where *T. cuspidata* is cultivated and many curious varieties have been produced. The genus is similar to *Taxodium* in its slow growth, and remarkable for the great bulk attained by older trees, as the celebrated Ankerlyke yew near Staines, in England, within sight of which the Magna Charta was signed, which is 27½ feet in girth; the Tisbury yew in Wilts, 37 feet; and the Fortingall yew in Perthshire, 56½; the first of these was estimated by Asa Gray to be at least 1,100 years old, and the second 1,600. See *yew*, and compare *hemlock-spruce*.

It was a modification of the earlier New England Calvinism, in that it insisted upon a real freedom of the will, a natural ability of moral choice, and a distinction between depravity as a tendency to sin and sin itself, the latter consisting wholly in a voluntary choice of evil. It was sharply opposed to Tylerism.

G. thee* = *Sw. Dan. te* = *NGr. τῆ* (NL. *thea*), prob., through Malay *te*, *teh*, < Chinese (Fukien dial.) *te* (pron. tā); (*b*) *cha*, *tcha*, *chau*, *chia*, *cia* = *Pg. cha* = *Sp. (esp. A product consisting of the prepared leaves of the tea-plant (see def. 2), of various kinds and qualities depending chiefly on the method of treatment. Black tea is manufactured by a process of withering under the influence of light, heat, and air, rolling, fermenting, sunning, and firing (heating with charcoal in a sieve); green tea by a more rapid process without the withering and fermenting, and with more firing. Among the chief black teas are *bohea*, *congou*, *souchong*, *caper-tea*, *oolong*, and *pekoe*; among the green, *tiangkay*, *hyson skin*, *young hyson*, *hyson*, *imperial*, and *gunpowder*. The gunpowder is the finest green, the pekoe the finest black, both being made from the first pickings—*flowering pekoe* from leaves so young as to be still covered with down. A third group of teas is known as the *scented*, generally of poorer quality,

flavored with the flowers of the fragrant olive (see *Osmanthus*), of the chulan, and sometimes of the Cape jasmine (see *Gardenia*) and of other plants. This classification applies more especially to Chinese teas. Tea became known in Europe during the seventeenth century. Among western nations the greatest consumers of tea are Great Britain, Russia, and the United States.

2. The tea-plant, *Camellia theifera*, often named *Thea Sinensis* (or *Chinensis*). The tea-plant is a shrub from 3 to 6 feet high, with leaves from 4 to 8 inches

long and from 1½ to 2½ inches broad, and tapering toward both ends; the flowers are white, and about 1½ inches broad. The cultivated plant is of a more contracted habit, with smaller, more obtuse, and leathery leaves. The plant is known to grow wild in upper Assam, the form there found having sometimes been distinguished as *Thea Assamica*, forming, with its varieties, Assam tea. The Assam plant is much superior to the Chinese, and the teas most planted are hybrids of the two. The Chinese tea has two varieties, formerly distinguished as *Thea Bohea* and *T. viridis*, black and green tea; but either kind of tea can be made from either plant. China is the great seat of tea-culture; but tea is also extensively grown in Japan, having been

introduced in the reign of Saga Tennō (A. D. 810–23), also in India and Java. Promising experiments have been made in Madagascar, Natal, Jamaica, etc. In the United States it can be grown successfully in the South and in California; but the cost of labor has thus far prevented its economic success.

3. An infusion of the prepared leaves of the tea-plant, used as a beverage, in Great Britain and America commonly with the addition of a little milk or sugar, or both, in continental Europe often with a little spirit, in Russia with lemon, and in China and neighboring countries without any admixture. Its action is stimulating and invigorating, and, owing to the presence of tannin, more or less astringent. Its main quality depends upon the alkaloid therein; the leaf contains also volatile oils, which give it its fragrance, and some other substances. Excessive use, especially of green tea, affects the nervous system unfavorably. While tea contains but trifling nutriment, it is held to retard the waste of the tissues and diminish the need of food.

That excellent and by all physicians approved China drink called by the Chinese *Tea*, and by other nations *tay*, alias *tee*, is sold at the Sultana Head Coffee House, London.

*Mercurius Politicus, Sept. 30, 1658.*

A drop or small quantity of the limpid fluid secreted by the lacrymal gland, appearing in the eye or falling from it; in the plural, the peculiar secretion of the lacrymal gland, serving to moisten the front of the eyeball and inner surfaces of the eyelids, and on occasion to wash out the eye or free it from specks of dirt, dust, or other irritating substances. Tears, like saliva, are continually secreted in a certain quantity, which is speedily and copiously increased when the activity of the gland is excited either by mechanical stimulation or by mental emotion. Any passion, tender or violent, as joy, anger, etc., and especially pain or grief, may excite the flow of tears, which is also immediately provoked by pain, especially in the eye itself. The tears ordinarily flow unperceived through the lacrymal canal or nasal duct into the nose; when the supply is too copious they overflow the lids and trickle down the cheek. Tears consist of slightly saline water, having an alkaline reaction.*

She whissched his feet with hire *Tears*, and wyped hem with hire Heer.

It is observed, for instance, that when a wine-glass partially filled with port wine is allowed to stand, the alcohol evaporates more rapidly than the water present with it; hence the latter tends to increase in proportion, and because of its higher surface-tension creeps up on the surface of the glass, dragging the other liquid with it, till drops are formed which roll down the sides again.

=**Syn.** 3. *Tease*, *Vex*, *Annoy*, *Molest*, *Badger*, *Pester*, *Bother*, *Worry*, *Plague*, *Torment*. All these words either may or must refer to repeated acts; they all suggest mental pain, but of degrees varying with the word or with the circumstances; all except *badger* and *molest* may be used reflexively, but with different degrees of appropriateness, *vex*, *worry*, and *torment* being the most common in such use; the agent may be a person, or, except with *badger*, it may be a creature, events, circumstances, etc.; it would be clearly figurative to use *tease* when the agent is not a person; all except *tease* are always used seriously. *Tease* is not a strong word, but has considerable breadth of use: a child may *tease* his mother for what he desires; there is a great deal of good-humored *teasing* of friends about their matrimonial intentions; a fly may *tease* a dog by continually waking him up. *Vex* is stronger, literally implying anger and figuratively applying to repeated attacks, etc., such as would produce an excitement as strong as anger. In Shakspeare's "still-vex'd Bermoothes" (*Tempest*, i. 2. 229), the use of *vex* is somewhat poetic or archaic, as is the application of the word to the continued agitation of the sea. *Annoy* has a middle degree of strength between *tease* and *vex*; a feeling of *annoyance* is somewhat short of *vexation*. We may be *annoyed* by the persistence of flies, beggars, duns, suitors, picket-firing, etc. *Molest* is generally a stronger word in its expression of harm done or intended, including the sense of disturbing once or often: some wild animals will not *molest* those who do not *molest* them. The next four words have a homely force—*badger* being founded upon the baiting of a badger by dogs, and thus implying persistence, energy, and some rudeness; *pester* implying similar persistence and much small vexation; *bother* implying weariness and perhaps confusion of the mind; and *worry* implying actual fatigue and even exhaustion. *Plague* and *torment* are very strong by the figurative extension of their primary meaning, although they are often used by hyperbole for that which is intolerable only by constant return: as, a *tormenting* fly. See *exasperate* and *harass*.

Lightly, hee [Wrath] is an olde man (for those yeares are most wayward and *teatish*), yet, be he neuer so olde or so froward, since Auarice likewise is a fellow vice of those fraile yeares, we must set one extreame to striue with another.

**tea-tree** (tē'trē), *n.* 1. The common tea-plant or tea-shrub. See *tea*, 2.—2. A name of various myrtaceous and other plants, chiefly of the genera *Lepidospermum* and *Melaleuca*, found in Australia, Tasmania, and New Zealand. See phrases below. Very abundant and conspicuous, especially in New Zealand, is *L. scoparium*, the broom tea-tree, known also as *tea-scrub*. It is an erect rigid shrub, or in the mountains prostrate, from 1 to 12 feet high, forming dense thickets, with leathery sharp-pointed foliage, covered for two months with abundant small white blossoms. Its wood, though small, is hard and useful for turning, etc. *L. laurigerum*, the Tasmanian tea-tree (found also in Australia), is a somewhat larger, very abundant shrub or tree, with a hard even-grained wood. The leaves of both are reputed to have been used by Captain Cook or early colonists as tea, which may account for the name, but the native Australian name of the former is *tī*. *Melaleuca uncinata*, the common tea-tree, is a shrub, or sometimes a tree from 40 to 80 feet high, with hard, heavy, durable wood, widely diffused in Australia.

Even the grass itself is not indigenous, all these hills [in New Zealand] having till recently been densely clothed with a thicket of *tea-tree*, which is a shrub somewhat resembling Juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris *manakau*, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called *tī* by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle.

C. F. G. Cunningham, in *The Century*, XXVII, 320.

**tea-urn** (tē'ēr-n), *n.* A vessel used on the tea-table for boiling water or keeping water hot: it differs from the tea-kettle chiefly in having a faucet or cock instead of a spout, so that it has not to be moved or tipped for drawing hot water.
